NovoLog® Mix70/30
insulin aspart protamine and insulin aspart injectable suspension 100 Units/mL

HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use NOVOLOG® MIX 70/30 safely and effectively. See full prescribing information for NOVOLOG® MIX 70/30.

NOVOLOG® MIX 70/30 (insulin aspart protamine and insulin aspart) injectable suspension, for subcutaneous use
Initial U.S. Approval: 2001

———  INDICATIONS AND USAGE  ———
NOVOLOG® MIX 70/30 is a mixture of insulin aspart protamine, an intermediate-acting human insulin analog, and insulin aspart, a rapid-acting human insulin analog, indicated to improve glycemic control in adult patients with diabetes mellitus.

Limitations of Use:
- Not recommended for the treatment of diabetic ketoacidosis.
- The proportions of rapid-acting and long-acting insulin are fixed and do not allow for basal versus prandial dose adjustments (1).

———  DOSAGE AND ADMINISTRATION  ———
- Inject NOVOLOG® MIX 70/30 subcutaneously in the abdominal region, buttocks, thigh, or upper arm (2.1).
- Administer the dose within 15 minutes before meal initiation. For patients with type 2 diabetes, the dose may also be given after meal initiation (2.1).
- Rotate injection sites within the same region from one injection to the next to reduce risk of lipodystrophy and localized cutaneous amyloidosis (2.1).
- Inspect visually before use. Appearance should be uniformly white and cloudy. Do not use if it looks clear or if it contains solid particles (2.1).
- NOVOLOG® MIX 70/30 must be resuspended immediately before use. Resuspension is easier when the insulin has reached room temperature (2.1).
- Do not administer intravenously or use in insulin infusion pumps (2.1).

- NOVOLOG® MIX 70/30 is typically dosed twice-daily (with each dose intended to cover 2 meals or a meal and a snack) (2.2).
- Individualize dosages based on metabolic needs, blood glucose monitoring results, and glycemic control goal (2.2).
- Dosage adjustments may be needed with changes in physical activity, changes in meal patterns (i.e., macronutrient content or timing of food intake), changes in renal or hepatic function or during acute illness (2.2).
- Dosage adjustment may be needed when switching from another insulin to NOVOLOG® MIX 70/30 (2.2).

———  DOSAGE FORMS AND STRENGTHS  ———
Injectable suspension: 100 units/mL (U-100) of NOVOLOG® MIX 70/30, 70% insulin aspart protamine and 30% insulin aspart available as:
- 10 mL multiple-dose vial (3)
- 3 mL single-patient-use NOVOLOG® MIX 70/30 FlexPen® (3)

———  CONTRAINDICATIONS  ———
- Do not use during episodes of hypoglycemia (4).
- Do not use in patients with hypersensitivity to NOVOLOG® MIX 70/30 or one of its excipients (4).

———  WARNINGS AND PRECAUTIONS  ———
- Never share a NOVOLOG® MIX 70/30 FlexPen® between patients, even if the needle is changed (5.1).
- Hyperglycemia or hypoglycemia with changes in insulin regimen: Make changes to a patient’s insulin regimen (e.g., insulin strength, manufacturer, type, injection site or method of administration) under close medical supervision with increased frequency of blood glucose monitoring (5.2).
- Hypoglycemia: May be life-threatening. Increase frequency of blood glucose monitoring with changes to: insulin dosage, meal pattern, physical activity; and in patients with renal or hepatic impairments and hypoglycemia unawareness (5.3).
- Medication Errors: Accidental mix-ups between insulin products can occur. Instruct patients to check insulin labels before injection (5.4).
- Hypersensitivity reactions: Severe, life-threatening, generalized allergy, including anaphylaxis, may occur. Discontinue NOVOLOG® MIX 70/30, treat, and monitor, if indicated (5.5).
- Hypokalemia: May be life-threatening. Monitor potassium levels in patients at risk of hypokalemia and treat if indicated (5.5).
- Fluid retention and heart failure with concomitant use of thiazolidinediones (TZDs) Observe for signs and symptoms of heart failure; consider dosage reduction or discontinuation if heart failure occurs (5.7).

———  ADVERSE REACTIONS  ———
Adverse reactions observed with insulin therapy include hypoglycemia, allergic reactions, local injection site reactions, lipodystrophy, rash and pruritus (6).

To report SUSPECTED ADVERSE REACTIONS, contact Novo Nordisk Inc. at 1-800-727-6500 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

———  DRUG INTERACTIONS  ———
- Drugs that may increase the risk of hypoglycemia: anti-diabetic agents, ACE inhibitors, angiotensin II receptor blocking agents, disopyramide, fibrates, fluoroxyn, monoamine oxidase inhibitors, pentoxifylline, pramipexole, salicylates, somatostatin analog (e.g., octreotide), and sulfonamide antibiotics (7).
- Drugs that may decrease the blood glucose lowering effect: atypical antipsychotics, corticosteroids, danazol, diuretics, estrogens, glucagon, isoniazid, niacin, oral contraceptives, phenothiazines, prostogestens (e.g., in oral contraceptives), protease inhibitors, somatropin, sympathomimetic agents (e.g., albuterol, epinephrine, terbutaline), and thyroid hormones (7).
- Drugs that may increase or decrease the blood glucose lowering effect: alcohol, beta-blockers, clonidine, lithium salts, and penamide (7).
- Drugs that may blunt the signs and symptoms of hypoglycemia: beta-blockers, clonidine, guanethidine, and reserpine (7).

See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling.

17 PATIENT COUNSELING INFORMATION
  *Sections or subsections omitted from the full prescribing information are not listed.
1. **INDICATIONS AND USAGE**

NOVOLOG® MIX 70/30 is a mixture of insulin aspart protamine and insulin aspart indicated to improve glycemic control in adult patients with diabetes mellitus.

2. **DOSE AND ADMINISTRATION**

2.1 Important Administration Information

- Always check insulin labels before administration [see Warnings and Precautions (5.4)].
- Inject NOVOLOG® MIX 70/30 subcutaneously in the abdominal region, buttocks, thigh, or upper arm.
- Administer the dose within 15 minutes before meal initiation. For patients with type 2 diabetes, the dose may also be given after meal initiation.
- Rotate injection sites within the same region from one injection to the next to reduce the risk of lipodystrophy and localized cutaneous amyloidosis. Do not inject into areas of lipodystrophy or localized cutaneous amyloidosis [see Warnings and Precautions (5.2) and Adverse Reactions (6.1, 6.3)].
- During changes to a patient’s insulin regimen, increase the frequency of blood glucose monitoring [see Warnings and Precautions (5.2)].
- Inspect NOVOLOG® MIX 70/30 visually before use. It should appear uniformly white and cloudy. Do not use it if it looks clear or if it contains solid particles.
- NOVOLOG® MIX 70/30 must be resuspended immediately before use. Resuspension is easier when the insulin has reached room temperature.
- When using the vial, roll the vial gently in hands in a horizontal position 10 times until the suspension appears uniformly white and cloudy. Inject immediately.
- When using NOVOLOG® MIX 70/30 FlexPen®, roll NOVOLOG® MIX 70/30 FlexPen® upside down so that the glass ball moves from one end of the reservoir to the other 10 times until the suspension appears uniformly white and cloudy. Inject immediately.
- The NOVOLOG® MIX 70/30 FlexPen® dials in 1-unit increments.
- Use NOVOLOG® MIX 70/30 FlexPen® with caution in patients with visual impairment who may rely on audible clicks to dial their dose.
- Do not administer NOVOLOG® MIX 70/30 intravenously or use in insulin infusion pumps.
- Do not mix NOVOLOG® MIX 70/30 with any other insulins.

2.2 Dosage Information

- NOVOLOG® MIX 70/30 is typically dosed twice-daily (with each dose intended to cover 2 meals and a meal and a snack).
- Individualize and adjust the dosage of NOVOLOG® MIX 70/30 based on the individual’s metabolic needs, blood glucose monitoring results, and glycemic control goals.
- Dosage adjustments may be needed with changes in physical activity, changes in meal patterns (i.e., macronutrient content or timing of food intake), changes in renal or hepatic function or during acute illness [see Warnings and Precautions (5.3) and Use in Specific Populations (8.6, 8.7)].
- Dosage adjustment may be needed when switching from another insulin to NOVOLOG® MIX 70/30 [see Warnings and Precautions (5.2)].

2.3 Dosage Adjustment Due to Drug Interactions

- Dosage adjustment may be needed when NOVOLOG® MIX 70/30 is co-administered with certain drugs [see Drug Interactions (7)].

3. **DOSES AND STRENGTHS**

Injectable suspension: 100 units/mL (U-100) of NOVOLOG® MIX 70/30, 70% insulin aspart protamine and 30% insulin aspart, is a white and cloudy suspension available as:

- 10 mL multiple-dose vial
- 3 mL single-patient-use NOVOLOG® MIX 70/30 FlexPen®

4. **CONTRAINDICATIONS**

NOVOLOG® MIX 70/30 is contraindicated:

- During episodes of hypoglycemia [see Warnings and Precautions (5.3)].
- In patients with hypersensitivity to NOVOLOG® MIX 70/30 or one of its excipients [see Warnings and Precautions (5.5)].

5. **WARNINGS AND PRECAUTIONS**

5.1 Never Share NOVOLOG® MIX 70/30 FlexPen® Between Patients

NOVOLOG® MIX 70/30 FlexPen® should never be shared between patients, even if the needle is changed. Patients using NOVOLOG® MIX 70/30 vials must never share needles or syringes with another person. Sharing poses a risk for transmission of blood-borne pathogens.

5.2 Hyperglycemia or Hypoglycemia with Changes in Insulin Regimen

Changes in an insulin regimen (e.g., insulin strength, manufacturer, type, injection site or method of administration) may affect glycemic results and may require dosage adjustments to glycemia [see Warnings and Precautions (5.3)] or hyperglycemia. Repeated insulin injections into areas of lipodystrophy or localized cutaneous amyloidosis have been reported to result in hypoglycemia, and a sudden change in the injection site to an unaffected area has been reported to result in hypoglycemia [see Adverse Reactions (6.1, 6.3)]. Make any changes to a patient’s insulin regimen under close medical supervision with increased frequency of blood glucose monitoring. Advise patients who have repeatedly injected into areas of lipodystrophy or localized cutaneous amyloidosis to change the injection site to unaffected areas and closely monitor for hypoglycemia.

5.3 Hypoglycemia

1. Hypoglycemia is the most common adverse effect of all insulins, including NOVOLOG® MIX 70/30. Severe hypoglycemia can cause seizures, may lead to unconsciousness, may be life threatening or cause death. Hypoglycemia can impair concentration, ability and reaction time, and may place an individual and others at risk in situations where these abilities are important (e.g., driving or operating other machinery).

Hypoglycemia can happen suddenly and symptoms may differ in each individual and change over time in the same individual. Symptomatic awareness of hypoglycemia is less pronounced in patients with longstanding diabetes in patients with diabetic nerve disease, in patients using medications that block the sympathetic nervous system (e.g., beta-blockers) [see Drug Interactions (7)], or in patients who experience recurrent hypoglycemia.

Risk Factors for Hypoglycemia

The risk of hypoglycemia after an injection is related to the duration of action of the insulin and, generally, is highest when the glucose lowering effect of the insulin is maximal. As with all insulins, the glucose lowering effect time course of NOVOLOG® MIX 70/30 may vary in different individuals or at different times in the same individual and depends on many conditions, including the area of injection as well as the injection site blood supply and temperature [see Clinical Pharmacology (12.2)]. Other factors which may affect the risk of hypoglycemia include changes in meal pattern (e.g., macronutrient content or timing of meals), changes in level of physical activity, or changes to co-administered medication [see Drug Interactions (7)]. Patients with renal or hepatic impairment may be at higher risk of hypoglycemia [see Use in Specific Populations (8.6, 8.7)].

Risk Mitigation Strategies for Hypoglycemia

Patients and caregivers must be educated to recognize and manage hypoglycemia. Self-monitoring of blood glucose plays an essential role in the prevention and management of hypoglycemia, increased frequency of blood glucose monitoring is recommended. In patients at higher risk for hypoglycemia and patients who have reduced symptomatic awareness of hypoglycemia, increased frequency of blood glucose monitoring is recommended.

5.4 Hypoglycemia Due to Medication Errors

Accidental mix-ups between insulin products have been reported. To avoid medication errors between NOVOLOG® MIX 70/30 and other insulins, instruct patients to always check the insulin label before each injection.

5.5 Hypersensitivity Reactions

Severe, life-threatening, generalized allergy including anaphylaxis, can occur with insulins, including NOVOLOG® MIX 70/30. If hypersensitivity reactions occur, discontinue NOVOLOG® MIX 70/30, treat for standard of care and monitor until symptoms and signs resolve [see Adverse Reactions (6)].

6. **ADVERSE REACTIONS**

The following adverse reactions are also discussed elsewhere:

- Hypoglycemia [see Warnings and Precautions (5.3)]
- Hypoglycemia Due to Medication Errors [see Warnings and Precautions (5.4)]
- Hypersensitivity reactions [see Warnings and Precautions (5.5)]
- Hypokalemia [see Warnings and Precautions (5.6)]

6.1 Clinical Trial Experience

Clinical trials are conducted under widely varying designs, therefore, the adverse reaction rates reported in one clinical trial may not be easily compared to those rates reported in another clinical trial, and may not reflect the rates actually observed in clinical practice. The data in Table 1 reflect the exposure of 55 patients with type 1 diabetes to NOVOLOG® MIX 70/30 with a mean exposure duration of three months. The mean age was 43.2 years. Sixty-four percent were male and 100% were White. The mean body mass index (BMI) was 26.1 kg/m². The mean duration of diabetes was 14.9 years.

The data in Table 2 reflect the exposure of 85 patients with type 2 diabetes to NOVOLOG® MIX 70/30 with a mean exposure duration of three months. The mean age was 62.7 years. Fifty-four percent were male and 100% were White. The mean body mass index (BMI) was 28.1 kg/m². The mean duration of diabetes was 15.0 years.

Common adverse events were defined as events occurring in ≥5%, excluding hypoglycemia, of the population studied. Other adverse events occurring for NOVOLOG® MIX 70/30–treated subjects in patients with type 1 diabetes mellitus and type 2 diabetes mellitus are listed in Table 1 and Table 2, respectively. The trial was a three-month, open-label trial in patients with type 1 or type 2 diabetes who were treated twice daily (before breakfast and before supper) with NOVOLOG® MIX 70/30.

8.1 Pregnancy

Risk Summary
There are no data on the presence of NOVOLOG® MIX 70/30 in human milk, the effects on the breastfed infant, or the effect on milk production. One small published study reported that exogenous insulin, including insulin aspart, was present in human milk. However, there is insufficient information to determine the effects of insulin aspart on the breastfed infant. The developmental and health benefits of breastfeeding should be considered along with the mother’s clinical need for NOVOLOG® MIX 70/30, and any potential adverse effects on the breastfed infant from NOVOLOG® MIX 70/30, or from the underlying maternal condition.

8.2 Lactation

Risk Summary
There are no data on the presence of NOVOLOG® MIX 70/30 in human milk, the effects on the breastfed infant, or the effect on milk production. One small published study reported that exogenous insulin, including insulin aspart, was present in human milk. However, there is insufficient information to determine the effects of insulin aspart on the breastfed infant. The developmental and health benefits of breastfeeding should be considered along with the mother’s clinical need for NOVOLOG® MIX 70/30, and any potential adverse effects on the breastfed infant from NOVOLOG® MIX 70/30, or from the underlying maternal condition.

8.4 Pediatric Use

Safety and effectiveness of NOVOLOG® MIX 70/30 have not been established in pediatric patients.

8.5 Geriatric Use

Clinical studies of NOVOLOG® MIX 70/30 did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently than younger patients. In elderly patients with diabetes, the initial dosing, dose increments should be smaller than the starting dose and the dose increments (see Dosage and Administration (2.1)).

8.6 Renal Impairment

The effect of renal impairment on the pharmacokinetics of NOVOLOG® MIX 70/30 has not been studied. Some studies with human insulin have shown increased circulating levels of insulin in patients with renal failure. Patients with renal

Severe Hypoglycemia

Hypoglycemia is the most commonly observed adverse reaction in patients using insulin, including NOVOLOG® MIX 70/30. The rates of reported hypoglycemia depend on the definition of hypoglycemia used, type insulin, dose, intensity of glucose control, background therapies, and other intrinsic and extrinsic patient factors. For these reasons, comparing rates of hypoglycemia in clinical trials for NOVOLOG® MIX 70/30 with the incidence of hypoglycemia for other products may be misleading and also, may not be representative of hypoglycemia rates that will occur in clinical practice.

Severe hypoglycemia requiring the assistance of another person and/or parental glucose infusion or glucagon administration has been observed in clinical trials with insulin, including trials with NOVOLOG® MIX 70/30.

The incidence of severe hypoglycemia in adult patients receiving subcutaneous NOVOLOG® MIX 70/30 was 16% and 4% for type 1 and type 2 diabetes patients respectively at 12 weeks (see Clinical Studies (14)).

Allergic Reactions

Patients have experienced reactions such as urticaria, edema or pruritus at the site of NOVOLOG® MIX 70/30 injection. These reactions usually resolve in a few days to a few weeks, but in some occasions, have required discontinuation of NOVOLOG® MIX 70/30.

Severe cases of generalized allergy (anaphylaxis) have been reported.

Insulin injection and glucose control intensification

Intensification or rapid improvement in glucose control has been associated with transfery, reversible ophthalmic refraction disorder, worsening of diabetic retinopathy, and acute painful peripheral neuropathy. However, long-term glycemic control decreases the risk of diabetic retinopathy and neuropathy.

Lipodystrophy

Long-term use of insulin, including NOVOLOG® MIX 70/30, can cause lipodystrophy at the site of repeated insulin injections. Lipodystrophy includes lipohypertrophy (thickening of adipose tissue) and lipatrophy (thinning of adipose tissue), and may affect insulin absorption (see Dosage and Administration (2.1)).

Weight gain

Weight gain can occur with insulins, including NOVOLOG® MIX 70/30, and has been attributed to the anabolic effects of insulin and the decrease in glucosuria.

Peripheral Edema

Insulins, including NOVOLOG® MIX 70/30, may cause sodium retention and edema, particularly if previously poor metabolic control is improved by intensified insulin therapy.

6.2 Immunogenicity

As with all therapeutic proteins, there is potential for immunogenicity. The detection of antibody formation is highly dependent on the sensitivity and specificity of the assay. Additionally, the observed incidence of antibody (including neutralizing antibody) positivity in an assay may be influenced by several factors including assay methodology, sample handling, timing of sample collection, concomitant medications, and underlying disease. For these reasons, comparison of the incidence of antibodies to NOVOLOG® MIX 70/30 in the studies described below with the incidence of antibodies in other studies or to other products may be misleading.

In a 3-month study with an extension in adult patients with type 2 diabetes, 100% of patients who received NOVOLOG® MIX 70/30 for positive anti-insulin antibodies (AIA) at least once during the first 12 months of the study including 91.4% that were positive at baseline. A total of 91.4% of patients who received NOVOLOG® MIX 70/30 for positive anti-drug antibodies (ADA) at least once during the first 12 months of the study, including 62.1% that were positive at baseline. In a type 2 diabetes clinical trial of NOVOLOG® MIX 70/30, initial increase in levels of antibodies to insulin followed by a decrease approaching to baseline values was observed in NOVOLOG® MIX 70/30 and Novolin® 70/30 treatment groups with similar incidences. These antibodies did not cause deterioration in glycemic control or result in neutralizing effects in insulin dose.

6.3 Postmarketing Experience

The following adverse reactions have been identified during post-approval use of NOVOLOG® MIX 70/30. Because these adverse reactions are reported voluntarily from a population of uncertain size, it is generally not possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Medication errors in which other insulins have been accidentally substituted for NOVOLOG® MIX 70/30 have been reported. Localized cutaneous amyloidosis at the injection site has occurred with insulin aspart. Hyperglycemia has been reported with repeated insulin injections into areas of localized cutaneous amyloidosis, hypoglycemia has been reported with a sudden change to an unaffected injection site.

</tbody>
</table>

In animal reproduction studies, administration of subcutaneous insulin aspart to pregnant rats and rabbits during the period of organogenesis did not cause adverse developmental effects at exposures 8-times and equal to the human subcutaneous dose of 1 unit/kg/day, respectively. Pre- and post-implantation losses and visceral/skeletal abnormalities were seen at higher exposures, which are considered secondary to maternal hypoglycemia. These effects were similar to those observed in rats administered regular human insulin (see Data).

The estimated background risk of major birth defects is 6-10% in women with pre-gestational diabetes with a HbA1c >7% and has been reported to be as high as 25-30% in women with a HbA1c >10%. The estimated background risk of miscarriage for the indicated population is unknown. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2.4% and 15-20%, respectively.

Clinical Considerations

Disease-Associated Maternal and/or Embryo-Fetal Risk

Poorly controlled diabetes in pregnancy increases the maternal risk for diabetic ketoacidosis, preeclampsia, spontaneous abortions, preterm delivery, and delivery complications. Poorly controlled diabetes increases the fetal risk for major birth defects, still birth, and macrosomia related morbidity.

Data

Published data from 5 randomized controlled trials of 441 pregnant women with diabetes mellitus treated with insulin aspart during the late 2nd trimester of pregnancy did not identify an association of insulin aspart with birth defects, adverse maternal or adverse fetal outcomes. However, these studies cannot definitively establish the absence of any risk because of methodological limitations, including a variable duration of treatment and small size of the majority of the trials.

Animal Data

Fertility, embryo-fetal and pre-and postnatal development studies have been performed with insulin aspart and regular human insulin in rats and rabbits. In a combined fertility and embryo-fetal development study in rats, insulin aspart was administered before, during mating, and throughout pregnancy. Further, in a pre- and postnatal development study in mice, insulin aspart was given throughout pregnancy and during lactation to rats. In an embryo-fetal development study insulin aspart was given to female rabbits during organogenesis. The effects of insulin aspart did not differ from those observed with subcutaneous regular human insulin. Insulin aspart, like human insulin, caused pre- and post-implantation losses and visceral/skeletal abnormalities in rats at a dose of 200 units/kg/day (approximately 32 times the human subcutaneous dose of 1 unit/kg/day, based on human exposure equivalents) and in rabbits at a dose of 10 units/kg/day (approximately 3 times the human subcutaneous dose of 1 unit/kg/day, based on human exposure equivalents). No significant effects were observed at doses of 1 unit/kg/day and in rabbits at a dose of 3 units/kg/day. These doses are approximately 8 times the human subcutaneous dose of 1 unit/kg/day for rats and equal to the human subcutaneous dose of 1 unit/kg/day for rabbits, based on human exposure equivalents. The effects are considered secondary to maternal hypoglycemia.
8.7 Hepatic Impairment

The effect of hepatic impairment on the pharmacokinetics of NOVOLOG® MIX 70/30 has not been studied. Patients with hepatic impairment may be at increased risk of hypoglycemia and may require more frequent NOVOLOG® MIX 70/30 dose adjustment and more frequent blood glucose monitoring [see Warnings and Precautions (5.3)].

10 OVERDOSAGE

Excess insulin administration may cause hypoglycemia and hypokalemia [see Warnings and Precautions (5.3. 5.6)]. Mild episodes of hypoglycemia usually can be treated with oral glucose. Adjustments in drug dosage, meal patterns, or exercise, may be needed. More severe episodes with coma, seizure, or neurologic impairment may be treated with intramuscular/subcutaneous glucagon or concentrated intravenous glucose. Sustained carbohydrate intake and observation may be necessary because hypoglycemia may recur after apparent clinical recovery. Hypokalemia must be corrected appropriately.

11 DESCRIPTION

Insulin aspart protamine and insulin aspart is a human insulin analog containing 70% insulin aspart protamine crystals and 30% soluble insulin aspart. Insulin aspart is homologous with regular human insulin with the exception of a single substitution of the amino acid proline by aspartic acid in position B28, and is produced by recombinant DNA technology utilizing Saccharomyces cerevisiae (baker’s yeast). Insulin aspart has the empirical formula C$_{27}$H$_{33}$N$_{5}$O$_{10}$S$_{2}$ and a molecular weight of 5625.8 Da. In vitro assay confirms the minimum potency of insulin aspart to be NLT 15 units/mg.

NOVOLOG® MIX 70/30 (insulin aspart protamine and insulin aspart) injectable suspension is a uniform, white and cloudy, sterile suspension for subcutaneous use. Each mL contains 100 units of insulin aspart and the inactive ingredients: disodium hydrogen phosphate dihydrate (1.25 mg), glycerol (16.0 mg), metacresol (1.72 mg), phenol (1.50 mg), protamine sulfate (0.32 mg), sodium chloroide (0.877 mg), zinc (19.6 mcg), and Water for Injection, USP. NOVOLOG® MIX 70/30 has a pH of 7.20 - 7.44. Hydrochloric acid or sodium hydroxide may be added to adjust pH.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

The primary activity of insulin, including NOVOLOG® MIX 70/30 is the regulation of glucose metabolism. Insulin and its analog lower blood glucose by stimulating peripheral glucose uptake, especially by skeletal muscle and fat, and by inhibiting hepatic glucose production. Insulin inhibits lipolysis and proteolysis, and enhances protein synthesis.

12.2 Pharmacodynamics

A euglycemic clamp study described below assessed glucose utilization after subcutaneous dosing of NOVOLOG® MIX 70/30 in healthy subjects (n = 24). Following a 0.3 units/kg single subcutaneous dose of NOVOLOG® MIX 70/30, the onset of action is between 10-20 minutes and the mean ± SD time to peak activity is 2.7 ± 0.9 hr. The duration of action may be as long as 24 hours (see Figure 2).

14 CLINICAL STUDIES

14.1 Clinical Studies in Adult Patients with Type 1 and Type 2 Diabetes

In a three-month, open-label trial, patients with type 1 (n=104) or type 2 (n=187) diabetes were treated twice daily (before breakfast and before supper) with NOVOLOG® MIX 70/30 or Novolin® 70/30. Patients had received insulin for at least 24 months before the study. Oral hypoglycemic agents were not allowed within 1 month prior to the study or during the study. The small changes in HbA1c were comparable across the treatment groups (see Table 4).

The mean age of the trial population for type 1 was 43.2 years and 62.7 years for type 2. For type 1, 64% were male and for type 2, 54% were male and 100% were White for type 1 and type 2. The mean body mass index (BMI) was 26.1 kg/m$^2$ for type 1 and 28.1 kg/m$^2$ for type 2. The mean duration of diabetes was 14.9 years for type 1 and 15.0 years for type 2.

The significance, with respect to the long-term clinical sequelae of diabetes, of the differences in postprandial hyperglycemia between treatment groups has not been established.

14.2 Clinical Studies in Adult Patients with Type 2 Diabetes with Insulin and Oral Antidiabetic Agents

Trial 1:
In a 34-week, open-label trial, insulin-naïve patients with type 2 diabetes currently treated with 2 oral antidiabetic agents were switched to treatment with metformin and pioglitazone. The mean age of the trial population was 53.4 years and mean duration of diabetes was 9.2 years. Forty-six percent were male. Eighty-five percent were White, 12% were Black and 3% were Asian. The mean BMI was approximately 32.4 kg/m$^2$. During an 8-week optimization period metformin and pioglitazone were increased to 2500 mg per day and 30 or 45 mg per day, respectively. After the optimization period, subjects were randomized to receive either NOVOLOG® MIX 70/30 twice daily added on to the metformin and pioglitazone regimen or continue the current optimized metformin and pioglitazone therapy. NOVOLOG® MIX 70/30 was started at a dose of 6 IU twice daily (before breakfast and before supper). Insulin doses were titrated to a pre-meal glucose goal of 80-110 mg/dL. The total daily insulin dose at the end of the study was 56.9 ± 30.5 IU.

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Information and Instructions for Use).

Never Share a NOVOLOG® MIX 70/30 FlexPen® between Patients

Advise patients that they must never share NOVOLOG® MIX 70/30 FlexPen® device with another person even if the needle is changed. Advise patients using NOVOLOG® MIX 70/30 vials not to share needles or syringes with another person. Sharing poses a risk for transmission of blood-borne pathogens [see Warnings and Precautions (5.1)].

Hyperglycemia or Hypoglycemia

Inform patients that hypoglycemia is the most common adverse reaction with insulin. Instruct patients on self-management procedures including glucose monitoring, proper injection technique, and management of hypoglycemia and hyperglycemia, especially at initiation of NOVOLOG® MIX 70/30 therapy. Instruct patients on handling of special situations such as intercurrent conditions (illness, stress, or emotional disturbances), an inadequate or skipped insulin dose, inadvertent administration of an increased insulin dose, inadequate food intake, and skipped meals. Instruct patients on the management of hypoglycemia [see Warnings and Precautions (5.3)].

Inform patients that their ability to concentrate and react may be impaired as a result of hypoglycemia. Advise patients who have frequent hypoglycemia or reduced or absent warning signs of hypoglycemia to use caution when driving or operating machinery.

Advise patients that changes in insulin regimen can predispose to hyperglycemia or hypoglycemia and that changes in insulin regimen should be made under close medical supervision [see Warnings and Precautions (5.2)].

Hypoglycemia with Medication Errors

Instruct patients to always check the insulin label before each injection to avoid mix-ups between insulin products [see Warnings and Precautions (5.4)].

Hypersensitivity Reactions

Advise patients that hypersensitivity reactions have occurred with NOVOLOG® MIX 70/30. Inform patients of the symptoms of hypersensitivity reactions [see Warnings and Precautions (5.5)].
Do not share your NovoLog® Mix 70/30 FlexPen® with other people, even if the needle has been changed. You may give other people a serious infection, or get a serious infection from them.

What is NovoLog® Mix 70/30?
• NovoLog® Mix 70/30 is a man-made insulin that is used to control high blood sugar in people with diabetes mellitus.
• It is not known if NovoLog® Mix 70/30 is safe and effective in children.

Who should not take NovoLog® Mix 70/30?
Do not take NovoLog® Mix 70/30 if you:
• are having an episode of low blood sugar (hypoglycemia).
• have an allergy to NovoLog® Mix 70/30 or any of the ingredients in NovoLog® Mix 70/30.

Before taking NovoLog® Mix 70/30, tell your healthcare provider about all your medical conditions including, if you are:
• pregnant, planning to become pregnant, or are breastfeeding.
• taking new prescription or over-the-counter medicines, vitamins, or herbal supplements.

Before you start taking NovoLog® Mix 70/30, talk to your healthcare provider about low blood sugar and how to manage it.

How should I take NovoLog® Mix 70/30?
• Read the Instructions for Use that come with your NovoLog® Mix 70/30.
• Take NovoLog® Mix 70/30 exactly as your healthcare provider tells you to.
• NovoLog® Mix 70/30 starts acting fast. If you have Type 1 diabetes, inject it up to 15 minutes before you eat a meal. Do not inject NovoLog® Mix 70/30 if you are not planning to eat within 15 minutes. If you have Type 2 diabetes, you may inject NovoLog® Mix 70/30 up to 15 minutes before or after starting your meal.
• Do not mix NovoLog® Mix 70/30 with other insulin products or use in an insulin pump.
• Know the type and strength of insulin you take. Do not change the type of insulin you take unless your healthcare provider tells you to. The amount of insulin and the best time for you to take your insulin may need to change if you take different types of insulin.
• Check your blood sugar levels. Ask your healthcare provider what your blood sugars should be and when you should check your blood sugar levels.
• Do not reuse or share your needles or syringes with other people. It may harm them.
• Do not inject where skin has pits, is thickened, or has lumps.
• Do not inject where the skin is tender, bruised, scaly or hard, or into scars or damaged skin.

What should I avoid while taking NovoLog® Mix 70/30?
While taking NovoLog® Mix 70/30 do not:
• Drive or operate heavy machinery, until you know how NovoLog® Mix 70/30 affects you.
• Drink alcohol or use prescription or over-the-counter medicines that contain alcohol.

What are the possible side effects of NovoLog® Mix 70/30?
NovoLog® Mix 70/30 may cause serious side effects that can lead to death, including:
Low blood sugar (hypoglycemia). Signs and symptoms that may indicate low blood sugar include:
• dizziness or light-headedness
• sweating
• confusion
• headache
• blurred vision
• slurred speech
• shakiness
• fast heart beat
• anxiety, irritability, or mood changes
• hunger

Your insulin dose may need to change because of:
• change in level of physical activity or exercise
• weight gain or loss
• increased stress
• illness
• change in diet

Other common side effects of NovoLog® Mix 70/30 may include:
• low potassium in your blood (hypokalemia), reactions at the injection site, itching, rash, serious allergic reactions (whole body reactions), skin thickening or pits at the injection site (lipodystrophy), weight gain, and swelling of your hands and feet.

Get emergency medical help if you have:
• trouble breathing, shortness of breath, fast heartbeat, swelling of your face, tongue, or throat, sweating, extreme drowsiness, dizziness, confusion.

These are not all the possible side effects of NovoLog® Mix 70/30. Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

General information about the safe and effective use of NovoLog® Mix 70/30.
Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. You can ask your pharmacist or healthcare provider for information about NovoLog® Mix 70/30 that is written for health professionals. Do not use NovoLog® Mix 70/30 for a condition for which it was not prescribed. Do not give NovoLog® Mix 70/30 to other people, even if they have the same symptoms that you have. It may harm them.

What are the ingredients in NovoLog® Mix 70/30?
Active Ingredient: 70% insulin aspart protamine and 30% insulin aspart.
Inactive Ingredients: disodium hydrogen phosphate dihydrate, glycerol, metacresol, phenol, protamine sulfate, sodium chloride, zinc, and Water for Injection, USP.
Hydrochloric acid or sodium hydroxide may be added to adjust pH.
Manufactured by: Novo Nordisk Inc., Plainsboro, NJ 08536 U.S. License Number 1261
For more information, go to www.novonordisk-us.com or call 1-800-727-6500.
Instructions for Use

NovoLog® Mix 70/30 (Nō-vo-Log-MIX-SEV-en-tee-THIR-tee) (insulin aspart protamine and insulin aspart) injectable suspension

10 mL multiple-dose vial (100 Units/mL, U-100)

Read this Instructions for Use before you start taking NovoLog® Mix 70/30 and each time you get a refill. There may be new information. This information does not take the place of talking to your healthcare provider about your medical condition or your treatment.

Supplies you will need to give your NovoLog® Mix 70/30 injection:
- 10 mL NovoLog® Mix 70/30 vial
- Insulin syringe and needle
- Alcohol swabs

Preparing your NovoLog® Mix 70/30 dose:
- Wash your hands with soap and water.
- Before you start to prepare your injection, check the NovoLog® Mix 70/30 label to make sure that you are taking the right type of insulin. This is especially important if you use more than 1 type of insulin.
- NovoLog® Mix 70/30 should look white and cloudy after mixing. Do not use NovoLog® Mix 70/30 if it looks clear or contains any lumps or particles.
- NovoLog® Mix 70/30 is easier to mix when it is at room temperature.
- After mixing NovoLog® Mix 70/30, inject your dose right away. If you wait to inject your dose, the insulin will need to be mixed again.
- Do not use NovoLog® Mix 70/30 past the expiration date printed on the label.

Step 1: If you are using a new vial, pull off the tamper-resistant cap (See Figure A).
Step 2: Wipe the rubber stopper with an alcohol swab (See Figure B).

Step 3: Roll the NovoLog® Mix 70/30 vial between your hands 10 times. Keep the vial in a horizontal (flat) position (See Figure C). Roll the vial between your hands 10 times. Keep the vial in a horizontal (flat) position (See Figure C). Roll the vial between your hands 10 times. Keep the vial in a horizontal (flat) position.
Step 4: Hold the syringe with the needle pointing up. Pull down on the plunger until the black tip reaches the line for your prescribed dose (See Figure D).
Step 5: Push the needle through the rubber stopper of the NovoLog® Mix 70/30 vial (See Figure E).

Step 6: Push the plunger all the way in. This puts air into the NovoLog® Mix 70/30 vial (See Figure F).

Step 7: Turn the NovoLog® Mix 70/30 vial and syringe upside down and slowly pull the plunger down until the black tip is a few units past the line for your dose (See Figure G).

Step 8: Slowly push the plunger up until the black tip reaches the line for your NovoLog® Mix 70/30 dose (See Figure I).

Step 9: Check the syringe to make sure you have the right dose of NovoLog® Mix 70/30.
Step 10: Pull the syringe out of the vial’s rubber stopper (See Figure J).

Giving your injection:
- Inject your NovoLog® Mix 70/30 exactly as your healthcare provider has shown you. Your healthcare provider should tell you if you need to pinch the skin before injecting.
- NovoLog® Mix 70/30 is injected under the skin (subcutaneously) of your stomach area, buttocks, upper legs, or upper arms.
- Change (rotate) your injection sites within the area you choose for each injection. Do not inject where the skin has pits, thickened, or has lumps. Do not inject where the skin is tender, bruised, scaly or hard, or into scars or damaged skin.

Step 11: Choose your injection site and wipe the skin with an alcohol swab. Let the injection site dry before you inject your dose (See Figure K).
Step 12: Insert the needle into your skin. Push down on the plunger to inject your dose (See Figure L). The needle should remain in the skin for at least 6 seconds to make sure you have injected all the insulin.
Step 13: Pull the needle out of your skin. After that, you may see a drop of NovoLog® Mix 70/30 at the needle tip. This is normal and does not affect the dose you just received (See Figure M).

After your injection:
- Do not recap the needle. Recapping the needle can lead to a needle stick injury.
- Put the empty insulin vials, used needles and syringes in a FDA-cleared sharps disposal container right away after use.
- Do not throw away (dispose of) loose needles and syringes in your household trash.
- If you do not have a FDA-cleared sharps disposal container, you may use a household container that is:
  - Made of a heavy-duty plastic,
  - Closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
  - Upright and stable during use,
  - Leak-resistant, and
  - Properly labeled to warn of hazardous waste inside the container.
- When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles and syringes. For more information about the safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA’s website at: http://www.fda.gov/safesharpsdisposal.
- Do not dispose of your used sharps disposal container in your household trash unless your community guidelines permit this.
- Do not recycle your used sharps disposal container.

How should I store NovoLog® Mix 70/30?
- Do not freeze NovoLog® Mix 70/30. Do not use NovoLog® Mix 70/30 if it has been frozen.
- Keep NovoLog® Mix 70/30 away from heat or light.

All unopened vials:
- Store unopened NovoLog® Mix 70/30 vials in the refrigerator at 36° F to 46°F (2°C to 8°C).
- Unopened vials may be used until the expiration date printed on the label. If they have been stored in the refrigerator.
- Unopened vials should be thrown away after 28 days, if they are stored at room temperature.

After vials have been opened:
- Opened NovoLog® Mix 70/30 vials can be stored in the refrigerator 36° F to 46°F (2°C to 8°C) or at room temperature below 86°F (30°C) for up to 28 days.
- Throw away all opened NovoLog® Mix 70/30 vials after 28 days, even if they still have insulin left in them.
General information about the safe and effective use of NovoLog® Mix 70/30

- Always use a new syringe and needle for each injection.
- Do not share syringes or needles.
- Keep NovoLog® Mix 70/30 vials, syringes, and needles out of the reach of children.
Instructions For Use

NovoLog® Mix 70/30 FlexPen® (Nøvo-Løg® Mix 70/30 FlexPen®) (insulin aspart protamine and insulin aspart) injectable suspension

Read the following instructions carefully before you start using your NovoLog® Mix 70/30 FlexPen® and each time you get a refill. There may be new information. You should read the instructions even if you have used NovoLog® Mix 70/30 FlexPen® before.

Do not share your NovoLog® Mix 70/30 FlexPen® with other people, even if the needle has been changed. You may give other people a serious infection, or get a serious infection from them.

NovoLog® Mix 70/30 FlexPen® is a disposable, single-patient-use dial-a-dose insulin pen. You can select doses from 1 to 60 units in increments of 1 unit. NovoLog® Mix 70/30 FlexPen® is designed to be used with NovoFine®, NovoFine® Plus or NovoTwist® needles. △ People who are blind or have vision problems should not use NovoLog® Mix 70/30 FlexPen® without help from a person trained to use NovoLog® Mix 70/30 FlexPen®.

Getting ready

Make sure you have the following items:
- NovoLog® Mix 70/30 FlexPen®
- New NovoFine®, NovoFine® Plus or NovoTwist® needle
- Alcohol swabs

Attaching the needle

D. Remove the protective tab from a disposable needle.

Screw the needle tightly onto your NovoLog® Mix 70/30 FlexPen®. It is important that the needle is put on straight (see diagram D). Never place a disposable needle on your NovoLog® Mix 70/30 FlexPen® until you are ready to take your injection.

F. Pull off the inner needle cap and throw it away (dispose of it) (see diagram F).

Always use a new needle for each injection to make sure the needle is free of germs (sterile) and to prevent blocked needles. Do not reuse or share your needles or syringes with other people. You may give other people a serious infection, or get a serious infection from them.

Be careful not to bend or damage the needle before use.

To reduce the risk of a needle stick, never put the inner needle cap back on the needle.

Giving the airshot before each injection

Before each injection small amounts of air may collect in the cartridge during normal use. To avoid injecting air and to make sure you take the right dose of insulin:

G. Turn the dose selector to select 2 units (see diagram G).

H. Hold your NovoLog® Mix 70/30 FlexPen® with the needle pointing up. Tap the cartridge gently with your finger a few times to make any air bubbles collect at the top of the cartridge (see diagram H).

I. Keep the needle pointing upwards, press the push-button all the way in (see diagram I). The dose selector returns to 0. A drop of insulin should appear at the needle tip. If not, change the needle and repeat the procedure no more than 6 times.

If you do not see a drop of insulin after 6 times, do not use the NovoLog® Mix 70/30 FlexPen® and contact Novo Nordisk at 1-800-727-6500. A small air bubble may remain at the needle tip, but it will not be injected.

Selecting your dose

Check and make sure that the dose selector is set at 0.

J. Turn the dose selector to the number of units you need to inject. The pointer should line up with your dose.

The dose can be corrected either up or down by turning the dose selector in either direction until the correct dose lines up with the pointer (see diagram J). When turning the dose selector, be careful not to press the push-button as insulin will come out.

You cannot select a dose larger than the number of units left in the cartridge. You will hear a click for every single unit dialed. Do not set the dose by counting the number of clicks you hear because you may get an incorrect dose.

△ Do not use the cartridge scale printed on the cartridge to measure your dose of insulin.

Giving the injection

- Do the injection exactly as shown to you by your healthcare provider. Your healthcare provider should tell you if you need to pinch the skin before injecting. Wipe the skin with an alcohol swab and let the area dry.
- NovoLog® Mix 70/30 can be injected under the skin (subcutaneously) of your stomach area, buttocks, upper legs (thighs), or upper arms.
- Change (rotate) your injection sites within the area you choose for each dose to reduce your risk of getting lipodystrophy (pits in skin or thickened skin) and localized cutaneous amyloidosis (skin with lumps) at the injection sites. Do not use the same injection site for each injection. Do not inject where the skin has pits, is thickened, or has lumps. Do not inject where the skin is tender, bruised, scaly or hard, or into scars or damaged skin.

K. Insert the needle into your skin.

Inject the dose by pressing the push-button all the way in until the 0 lines up with the pointer (see diagram K). Be careful only to push the button when injecting. Turning the dose selector will not inject insulin.

L. Keep the needle in the skin for at least 6 seconds, and keep the push-button pressed all the way in until the needle has been pulled out from the skin (see diagram L). This will make sure that the full dose has been given.

You may see a drop of insulin at the needle tip. This is normal and has no effect on the dose you just received. It blood appears after you take the needle out of your skin, press the injection site lightly with an alcohol swab. Do not rub the area.
After the injection

**Do not recap the needle.** Recapping can lead to a needle stick injury. Remove the needle from the NovoLog® Mix 70/30 FlexPen® after each injection and dispose of it. This helps to prevent infection, leakage of insulin, and will help to make sure you inject the right dose of insulin.

- Put your used needles in a FDA-cleared sharps disposal container right away after use. Do not throw away (dispose of) loose needles in your household trash.
- If you do not have a FDA-cleared sharps disposal container, carefully slip the needle into the outer needle cap and throw it away in a household container that is:
  - made of a heavy-duty plastic,
  - can be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
  - upright and stable during use,
  - leak-resistant, and
  - properly labeled to warn of hazardous waste inside the container
- When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles and syringes. For more information about the safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA’s website at: http://www.fda.gov/safesharpsdisposal.

Do not dispose of your used sharps disposal container in your household trash unless your community guidelines permit this. Do not recycle your used sharps disposal container.

- When there is not enough medicine left in your NovoLog® Mix 70/30 FlexPen® for your prescribed dose, the NovoLog® Mix 70/30 FlexPen® may be thrown away in your household trash after you have removed the needle.

The NovoLog® Mix 70/30 FlexPen® prevents the cartridge from being completely emptied. It is designed to deliver 300 units.

**M.** Put the pen cap on the NovoLog® Mix 70/30 FlexPen® and store the NovoLog® Mix 70/30 FlexPen® without the needle attached (see diagram M). Storing without the needle attached helps prevent leakage, blocking of the needle, and air from entering the Pen.

**How should I store NovoLog® Mix 70/30 FlexPen®?**

- Do not freeze NovoLog® Mix 70/30. Do not use NovoLog® Mix 70/30 if it has been frozen.
- Keep NovoLog® Mix 70/30 away from heat or light.
- Store the NovoLog® Mix 70/30 FlexPen® without the needle attached.
  - **Unused NovoLog® Mix 70/30 FlexPen®:**
    - Store unused NovoLog® Mix 70/30 FlexPen® in the refrigerator at 36°F to 46°F (2°C to 8°C).
    - Unused NovoLog® Mix 70/30 FlexPen® may be used until the expiration date printed on the label, if kept in the refrigerator.
  - Unused NovoLog® Mix 70/30 FlexPen® should be thrown away after 14 days, if it is stored at room temperature.
- **In-Use NovoLog® Mix 70/30 FlexPen®:**
  - Store the FlexPen® you are currently using at room temperature below 86°F (30°C) for up to 14 days.
  - The NovoLog® Mix 70/30 FlexPen® you are using should be thrown away after 14 days, even if it still has insulin left in it.

**Maintenance**

For the safe and proper use of your NovoLog® Mix 70/30 FlexPen®, be sure to handle it with care. Avoid dropping your NovoLog® Mix 70/30 FlexPen® as it may damage it. If you are concerned that your NovoLog® Mix 70/30 FlexPen® is damaged, use a new one. You can clean the outside of your NovoLog® Mix 70/30 FlexPen® by wiping it with a damp cloth. Do not soak or wash your NovoLog® Mix 70/30 FlexPen® as it may damage it. Do not refill your NovoLog® Mix 70/30 FlexPen®.

- Remove the needle from the NovoLog® Mix 70/30 FlexPen® after each injection. This helps to ensure sterility, prevent leakage of insulin, and will help to make sure you inject the right dose of insulin for future injections.
- Be careful when handling used needles to avoid needle sticks and transfer of infectious diseases.
- Keep your NovoLog® Mix 70/30 FlexPen® and needles out of the reach of children.

**Use NovoLog® Mix 70/30 FlexPen®** as directed to treat your diabetes.

**Do not** share your NovoLog® Mix 70/30 FlexPen® or needles with other people. You may give other people a serious infection, or get a serious infection from them.

Always use a new needle for each injection.

Novo Nordisk is not responsible for harm due to using this insulin pen with products not recommended by Novo Nordisk.

As a precautionary measure, always carry a spare insulin delivery device in case your NovoLog® Mix 70/30 FlexPen® is lost or damaged.

Remember to keep the disposable NovoLog® Mix 70/30 FlexPen® with you. Do not leave it in a car or other location where it can get too hot or too cold.
