HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use WEGOVY™ safely and effectively. See full prescribing information for WEGOVY™.

WEGOVY™ (semaglutide) injection, for subcutaneous use

Initial U.S. Approval: 2017

WARNING: RISK OF THYROID C-CELL TUMORS

See full prescribing information for complete boxed warning.

• In rodents, semaglutide causes thyroid C-cell tumors at clinically relevant exposures. It is unknown whether WEGOVY™ causes thyroid C-cell tumors, including medullary thyroid carcinoma (MTC), in humans as the human relevance of semaglutide-induced rodent thyroid C-cell tumors has not been determined (5.1, 13.1).

• WEGOVY™ is contraindicated in patients with a personal or family history of MTC or in patients with Multiple Endocrine Neoplasia syndrome type 2 (MEN 2). Counsel patients regarding the potential risk of MTC and symptoms of thyroid tumors (4, 5.1).

——— RECENT MAJOR CHANGES ———

Indications and Usage (1).................................12/2022
Dosing and Administration (2.1, 2.4).........................12/2022
Dosing and Administration (2.3)..........................07/2023
Warnings and Precautions (5.3, 5.6, 5.8).................12/2022

——— INDICATIONS AND USAGE ———

WEGOVY™ is a glucagon-like peptide-1 (GLP-1) receptor agonist indicated as an adjunct to a reduced calorie diet and increased physical activity for chronic weight management in:
• adult patients with an initial body mass index (BMI) of
  • 30 kg/m² or greater (obesity) or
  • 27 kg/m² or greater (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, type 2 diabetes mellitus, or dyslipidemia) (1).
• pediatric patients aged 12 years and older with an initial BMI at the 95th percentile or greater for age and sex (obesity) (1).

Limits of Use:
• WEGOVY™ should not be used in combination with other semaglutide-containing products or any other GLP-1 receptor agonist (1).
• The safety and efficacy of coadministration with other products for weight loss have not been established (1).
• WEGOVY™ has not been studied in patients with a history of pancreatitis (1).

——— DOSAGE AND ADMINISTRATION ———

• Administer WEGOVY™ once weekly, on the same day each week, at any time of day, with or without meals (2.2).
• Inject subcutaneously in the abdomen, thigh or upper arm (2.2).
• In patients with type 2 diabetes, monitor blood glucose prior to starting and during WEGOVY™ treatment (2.2).
• Initiate at 0.25 mg once weekly for 4 weeks. In 4 week intervals, increase the dose until a dose of 2.4 mg is reached (2.3).
• The maintenance dosage of WEGOVY™ in adults is either 2.4 mg (recommended) or 1.7 mg once-weekly (2.3).
• The maintenance dosage of WEGOVY™ in pediatric patients aged 12 years and older is 2.4 mg weekly (2.4).

——— DOSAGE FORMS AND STRENGTHS ———

• Injection: pre-filled, single-dose pen that delivers doses of 0.25 mg, 0.5 mg, 1 mg, 1.7 mg or 2.4 mg (3).

——— CONTRAINDICATIONS ———

• Personal or family history of MTC or in patients with MEN2 (4).
• Known hypersensitivity to semaglutide or any of the excipients in WEGOVY™ (4).
• Acute Pancreatitis: Has occurred in clinical trials. Discontinue promptly if pancreatitis is suspected. Do not restart if pancreatitis is confirmed (5.2).
• Acute Gallbladder Disease: Has occurred in clinical trials. If cholelithiasis is suspected, gallbladder studies and clinical follow-up are indicated (5.3).
• Hypoglycemia: Concomitant use with an insulin secretagogue or insulin may increase the risk of hypoglycemia, including severe hypoglycemia. Reducing the dose of insulin secretagogue or insulin may be necessary. Inform all patients of the risk of hypoglycemia and educate them on the signs and symptoms of hypoglycemia (5.4).

——— ADVERSE REACTIONS ———

Most common adverse reactions (incidence ≥ 5%) in adults or pediatric patients aged 12 years and older are: nausea, diarrhea, vomiting, constipation, abdominal pain, headache, fatigue, dyspepsia, dizziness, abdominal distension, eructation, hypoglycemia in patients with type 2 diabetes, flatulence, gastroenteritis, gastroesophageal reflux disease, and nasopharyngitis (6.1).

To report SUSPECTED ADVERSE REACTIONS, contact Novo Nordisk Inc., at 1-833-934-6891 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

——— DRUG INTERACTIONS ———

WEGOVY™ delays gastric emptying. May impact absorption of concomitantly administered oral medications. Use with caution (7.2).

——— USE IN SPECIFIC POPULATIONS ———

• Pregnancy: May cause fetal harm. When pregnancy is recognized, discontinue WEGOVY™ (8.1).
• Females and Males of Reproductive Potential: Discontinue WEGOVY™ at least 2 months before a planned pregnancy because of the long half-life of semaglutide (8.3).

See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.

Revised: 07/2023

### 1. INDICATIONS AND USAGE

**WEGOVY** is indicated as an adjunct to a reduced calorie diet and increased physical activity for chronic weight management.

- **adults** with an initial body mass index (BMI) of [see Dosage and Administration (2.1)]:
  - > 30 kg/m² or greater (obesity) or
  - > 27 kg/m² or greater (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, type 2 diabetes mellitus, or dyslipidemia).
- **pediatric patients** aged 12 years and older with an initial BMI at the 95th percentile or greater standardized for age and sex (obesity) [see Dosage and Administration (2.1)].

### 2. DOSAGE AND ADMINISTRATION

#### 2.1 Patient Selection

**Adult Patients**

Select adult patients for WEGOVY treatment as an adjunct to a reduced-calorie diet and increased physical activity for chronic weight management based on their BMI. Table 1 presents a chart for determining BMI based on height and weight. BMI is calculated by dividing weight (in kilograms) by height (in meters) squared.

#### 2.2 Important Monitoring and Administration Instructions

- **in patients with type 2 diabetes**, monitor blood glucose prior to starting WEGOVY and during WEGOVY treatment [see Warnings and Precautions (5.4)].

**Maintenance Dosage**

- The maintenance dosage of WEGOVY is either 2.4 mg (recommended) or 1.7 mg once-weekly. Consider treatment response and tolerability when selecting the maintenance dosage [see Clinical Studies (14.1)].

#### 2.4 Recommended Dosage in Pediatric Patients Aged 12 Years and Older

**Dosage Initiation and Escalation**

- Initiate WEGOVY according to the dosage escalation schedule in Table 4 to minimize gastrointestinal adverse reactions [see Adverse Reactions (6.1)].
- If patients do not tolerate a dose during dosage escalation, consider delaying dosage escalation for 4 weeks.
- The 0.25 mg, 0.5 mg, and 1 mg once-weekly dosages are initiation and escalation dosages and are not approved as maintenance dosages for chronic weight management.

#### 2.3 Recommended Dosage in Adults

**Dosage Initiation and Escalation**

- Initiate WEGOVY with a dosage of 0.25 mg injected subcutaneously once-weekly. Then follow the dose escalation schedule presented in Table 3 to minimize gastrointestinal adverse reactions [see Adverse Reactions (6.1)].
- If patients do not tolerate a dose during dosage escalation, consider delaying dosage escalation for 4 weeks.
- The 0.25 mg, 0.5 mg, and 1 mg once-weekly dosages are initiation and escalation dosages and are not approved as maintenance dosages for chronic weight management.

#### Table 3. Recommended Dosage Regimen for Adults

*Dosage not approved as maintenance for chronic weight management.

**Maintenance Dosage**

- The maintenance dosage of WEGOVY is either 2.4 mg (recommended) or 1.7 mg once-weekly. Consider treatment response and tolerability when selecting the maintenance dosage [see Clinical Studies (14.1)].

**Dosage Initiation and Escalation**

- Initiate WEGOVY according to the dosage escalation schedule in Table 4 to minimize gastrointestinal adverse reactions [see Adverse Reactions (6.1)].
- If patients do not tolerate a dose during dosage escalation, consider delaying dosage escalation for 4 weeks.
- The 0.25 mg, 0.5 mg, and 1 mg once-weekly dosages are initiation and escalation dosages and are not approved as maintenance dosages for chronic weight management.

**Dosage Regimen**

- The maintenance dosage of WEGOVY is either 2.4 mg (recommended) or 1.7 mg once-weekly.

**Dosage Modifications for Adverse Reactions**

- If patients do not tolerate a dose during dosage escalation, consider delaying dosage escalation for 4 weeks.
- The 0.25 mg, 0.5 mg, and 1 mg once-weekly dosages are initiation and escalation dosages and are not approved as maintenance dosages for chronic weight management.
3.3 Acute Pancreatitis

Acute pancreatitis, including fatal and non-fatal hemorrhagic or necrotizing pancreatitis, has been observed in patients treated with GLP-1 receptor agonists, including semaglutide. Acute pancreatitis was observed in patients treated with WEGOVY® in clinical trials (see Adverse Reactions (6.2)). After initiation of WEGOVY® treatment, observe patients carefully for signs and symptoms of acute pancreatitis (including persistent severe abdominal pain, sometimes radiating to the back, and which may or may not be accompanied by vomiting). If acute pancreatitis is suspected, WEGOVY® should promptly be discontinued and appropriate management should be initiated. If acute pancreatitis is confirmed, WEGOVY® should not be restarted.

WEGOVY® has not been studied in patients with a history of pancreatitis. It is unknown if patients with a history of pancreatitis are at higher risk for development of pancreatitis on WEGOVY®.

5.3 Acute Gallbladder Disease

Treatment with WEGOVY® was associated with an increased occurrence of cholecystitis and cholelithiasis. The incidence of cholecystitis and cholelithiasis was higher in WEGOVY®-treated pediatric patients (6.5% and 7.8%) than in WEGOVY®-treated adults. In randomized clinical trials in adult patients, cholecystitis was reported by 1.6% of WEGOVY®-treated patients and 0.7% of placebo-treated patients. Cholelithiasis was reported by 0.6% of WEGOVY®-treated adult patients and 0.2% of placebo-treated patients. In a clinical trial in pediatric patients (aged 12 years and older), cholecystitis was reported by 3.8% of WEGOVY®-treated patients and 0% placebo-treated patients. Cholecystitis was reported by 0.8% of WEGOVY®-treated pediatric patients and 0% placebo-treated patients (see Adverse Reactions (6.1)). Substantial or rapid weight loss can increase the risk of cholecystitis; however, the incidence of acute gallbladder disease was greater in WEGOVY®-treated patients than in placebo-treated patients, even after accounting for the degree of weight loss. If cholecystitis is suspected, gallbladder studies and appropriate medical management should be initiated.

5.4 Hypoglycemia

WEGOVY® lowers blood glucose and can cause hypoglycemia. In a trial of adult patients with type 2 diabetes and BMI greater than or equal to 27 kg/m², hypoglycemia (defined as a plasma glucose less than 54 mg/dL) was reported in 6.2% of WEGOVY®-treated patients versus 2.5% of placebo-treated patients. One episode of severe hypoglycemia (requiring the assistance of another person) was reported in one WEGOVY®-treated patient versus no placebo-treated patients. Patients with type 2 diabetes mellitus taking WEGOVY® in combination with an insulin secretagogue (e.g., sulfonylurea) or insulin may have an increased risk of hypoglycemia, including severe hypoglycemia. In patients (both diabetic and non-diabetic) with insulin, it has been observed in patients treated with semaglutide at doses of 0.5 and 1 mg in combination with insulin. The addition of WEGOVY® in patients treated with insulin has not been evaluated. Inform patients of the risk of hypoglycemia and educate them on the signs and symptoms of hypoglycemia. In patients with type 2 diabetes and mortality, monitoring glucose levels prior to starting WEGOVY® and during WEGOVY® treatment. When initiating WEGOVY®, consider reducing the dose of concomitantly administered insulin secretagogue (such as sulfonylureas) or insulin to reduce the risk of hypoglycemia (see Drug Interactions (7)).

5.5 Acute Kidney Injury

There have been postmarketing reports of acute kidney injury and worsening of chronic renal failure, which have in some cases required hemodialysis, in patients treated with semaglutide. Patients with renal impairment may be at greater risk of acute kidney injury, but some of these events have been reported in patients with moderate kidney disease. A review of the reported events occurred in patients who had experienced nausea, vomiting, or diarrhea, leading to volume depletion (see Adverse Reactions (6)). Monitor renal function when initiating or escalating doses of WEGOVY® in patients reporting severe adverse gastrointestinal symptoms, including vomiting, diarrhea, and dehydration, and who are actively and appropriately reporting any adverse reactions that could lead to volume depletion.

5.6 Hyersensitivity Reactions

Serious hypersensitivity reactions (e.g., anaphylaxis, angioedema) have been reported with WEGOVY®. If hypersensitivity reactions occur, discontinue use of WEGOVY®, treat promptly per standard medical criteria, initiate treatment for anaphylactoid or anaphylactic reactions. WEGOVY® is contraindicated in patients with a prior serious hypersensitivity reaction to semaglutide or to any of the excipients in WEGOVY® (see Adverse Reactions (6.2)).

Anaphylaxis and angioedema have been reported with other GLP-1 receptor agonists in patients with a history of anaphylaxis or angioedema with another GLP-1 receptor agonist because it is unknown whether such patients will be predisposed to these reactions with WEGOVY®.

5.7 Diabetic Retinopathy Complications in Patients with Type 2 Diabetes

In a trial of adult patients with type 2 diabetes and BMI greater than or equal to 27 kg/m², diabetic retinopathy complications were reported by 4.0% of WEGOVY®-treated patients and 2.7% placebo-treated patients. In a 2-year trial with semaglutide 0.5 mg and 1 mg once-weekly injection in adult patients with type 2 diabetes and high cardiovascular risk, diabetic retinopathy complications (which was a 4-component adjudicated endpoint) occurred in patients treated with semaglutide injection (3.0% compared to placebo (1.8%). The absolute risk increase for diabetic retinopathy complications was larger among patients with a history of diabetic retinopathy at baseline (semaglutide injection 8.2%, placebo 5.2%) than among patients without a known history of diabetic retinopathy (semaglutide injection 0.7%, placebo 0.4%). Rapid improvement in glucose control has been associated with a temporary worsening of diabetic retinopathy. The effect of long-term glycemic control with semaglutide on diabetic retinopathy has not been studied. Patients with a history of diabetic retinopathy should be monitored for progression of diabetic retinopathy.

5.8 Heart Rate Increase

Treatment with WEGOVY® was associated with increases in resting heart rate. Mean increases in resting heart rate of 1 to 4 beats per minute (bpm) were observed in WEGOVY®-treated adult patients compared to placebo in clinical trials. More adult patients treated with WEGOVY® compared with placebo had maximum changes in heart rate of 20 bpm or more (54% versus 39%) (see Adverse Reactions (6.1)). Monitor heart rate at regular intervals consistent with usual clinical practice. Instruct patients to inform their healthcare providers of palpitations or feelings of a racing heartbeat while at rest during WEGOVY® treatment. If patients experience a sustained increase in resting heart rate, discontinue WEGOVY®.

6. ADVERSE REACTIONS

The following serious adverse reactions are described below or elsewhere in the prescribing information:

• Acute Pancreatitis
• Acute Gallbladder Disease
• Acute Kidney Injury
• Hypoglycemia
• Acute Diabetic Ketoacidosis
• Diabetic Retinopathy Complications in Patients with Type 2 Diabetes
• Heart Rate Increase
• Suicidal Behavior and Ideation

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical studies of another drug and may not reflect the rates observed in practice.

Adverse Reactions in Clinical Trials in Adults with Obesity or Overweight

WEGOVY® 2.4 mg Subcutaneous Weekly Dosage

WEGOVY® was evaluated for safety in 3 randomized, double-blind, placebo-controlled trials that included 2,116 adult patients with obesity or overweight treated with 2.4 mg WEGOVY® for up to 26 weeks and a 7 week off-drug follow-up period (see Clinical Studies (14.1)). Baseline characteristics included a mean age of 48 years, 71% women, 72% White, 14% Asian, 9% Black or African American, and 5% reported as other or unknown, and 85% were not Hispanic or Latino ethnicity, 13% were Hispanic or Latino ethnicity and 2% reported as unknown. The baseline characteristics were 42% with hypertension, 19% with type 2 diabetes, 43% with dyslipidemia, 28% with a BMI greater than 40 kg/m², and 4% with cardiovascular disease.

In clinical trials, 6.8% of patients treated with 2.4 mg WEGOVY® and 3.2% of patients treated with placebo permanently discontinued treatment as a result of adverse reactions. The most common adverse reactions (reported in greater than 5% of patients and not attributable to discontinuation were nausea (1.8% versus 0.2%), vomiting (1.2% versus 0%), and diarrhea (0.7% versus 0.1%) for WEGOVY® and placebo, respectively. Adverse reactions reported in clinical trials in adults and greater than or equal to 2% of WEGOVY®-treated patients and more frequently than in placebo-treated patients are shown in Table 5.

4Includes abdominal pain, abdominal pain upper, abdominal pain lower, gastrointestinal pain, abdominal tenderness, abdominal discomfort and epigastric discomfort.
5Includes fatigue and asthenia.
6Defined as blood glucose <54 mg/dL with or without symptoms of hypoglycemia or severe hypoglycemia (requiring the assistance of another person) in patients with type 2 diabetes not on concomitant insulin (Study 2, WEGOVY® N=403, Placebo N=402). See text below for further information regarding hypoglycemia in patients with and without type 2 diabetes. T2DM = type 2 diabetes mellitus.
7Includes chronic gastritis, gastritis, gastritis erosive, and reflux gastritis.

WEGOVY® 1.7 mg Subcutaneous Weekly Dosage

WEGOVY® 1.7 mg subcutaneous weekly was evaluated in safety in a 68-week, randomized, double-blind, parallel-group, placebo-controlled trial in 401 patients with obesity or overweight. Adverse reactions observed with WEGOVY® 1.7 mg were similar to those reported with WEGOVY® 2.4 mg.

Adverse Reactions in a Clinical Trial of Pediatric Patients Aged 12 Years and Older with Obesity

WEGOVY® was evaluated in a 68-week, double-blind, randomized, parallel-group, placebo-controlled, multi-center trial in 201 pediatric patients aged 12 years and older with obesity (see Clinical Studies [14.2]). Baseline characteristics included a mean age of 15.4 years; 38% of patients were male; 79% were White; 8% were Black or African American, 2% were Asian, and 11% were of other or unknown race; and 11% were of Hispanic or Latino ethnicity. The mean baseline body weight was 107.5 kg, and mean BMI was 37 kg/m².

Other Adverse Reactions in Adults and/or Pediatric Patients

Acute Pancreatitis

In WEGOVY® clinical trials in adults, acute pancreatitis was confirmed with adjudication in 4 WEGOVY®-treated patients (0.2 cases per 100 patient years) versus 1 in placebo-treated patients (less than 0.1 cases per 100 patient years). One additional case of acute pancreatitis was confirmed in a patient treated with WEGOVY® in another clinical trial.

Acute Gallbladder Disease

In WEGOVY® clinical trials in adults, cholelithiasis was reported by 1.6% of WEGOVY®-treated patients and 0.7% of placebo-treated patients. Cholecystitis was reported by 0.6% of WEGOVY®-treated adult patients and 0.2% of placebo-treated patients. In a clinical trial in pediatric patients aged 12 years and older, cholelithiasis was reported by 3.8% of WEGOVY®-treated patients and 0% placebo-treated patients. Cholecystitis was reported by 0.8% of WEGOVY®-treated pediatric patients and 0% placebo-treated patients.

Hypoglycemia

Patients with Type 2 Diabetes

Episodes of hypoglycemia have been reported with GLP-1 receptor agonists in adult patients without type 2 diabetes mellitus. In WEGOVY® clinical trials in adult patients without type 2 diabetes mellitus, there was no systematic capturing or reporting of hypoglycemia.

Acute Kidney Injury

Acute kidney injury occurred in clinical trials in 7 adult patients (0.4 cases per 100 patient years) receiving WEGOVY® versus 4 patients (0.2 cases per 100 patient years) exposure) receiving placebo. Some of these adverse reactions occurred in association with gastrointestinal adverse reactions or dehydration. In addition, 2 patients treated with WEGOVY® had acute kidney injury with dehydration in other clinical trials. The risk of renal adverse reactions with WEGOVY® was increased in adult patients with a history of renal impairment (trials included 65 patients with a history of moderate or severe renal impairment at baseline), and occurred more frequently during dose titration.

Retinal Disorders in Patients with Type 2 Diabetes

In a trial of adult patients with type 2 diabetes and BMI greater than or equal to 27 kg/m², retinal disorders were reported by 6.9% of patients treated with WEGOVY® (semaglutide 2.4 mg), 6.2% of patients treated with semaglutide 1 mg, and 4.2% of patients treated with placebo. The majority of events were reported as diabetic retinopathy (4.0%, 2.7%, and 2.7%, respectively) and non-proliferative retinopathy (0.7%, 0.0%, and 0.0%, respectively).

Increase in Heart Rate

Mean increases in resting heart rate of 1 to 4 beats per minute (bpm) were observed in routine clinical monitoring in WEGOVY®-treated adult patients compared to placebo in clinical trials. In trials in which adult patients were randomized prior to dose-escalation, more patients treated with WEGOVY®, compared with placebo, had maximum changes from baseline at any visit of 10 to 19 bpm (41% versus 34%, respectively) and 20 bpm or more (26% versus 16%, respectively). In a clinical trial in pediatric patients aged 12 years and older with normal baseline heart rate, more patients treated with WEGOVY® compared to placebo had maximum changes in heart rate of 20 bpm or more (54% versus 39%).

Hypotension and Syncope

Adverse reactions related to hypotension (hypotension, orthostatic hypotension, and decreased blood pressure) were reported in 1.3% of WEGOVY®-treated adult patients versus 0.4% of placebo-treated patients and syncope was reported in 0.8% of WEGOVY®-treated patients versus 0.2% of placebo-treated patients. Some reactions were related to gastrointestinal adverse reactions and volume loss associated with WEGOVY®. Hypotension and orthostatic hypotension were more frequently seen in patients on concomitant antithyroid therapy. In a clinical trial in pediatric patients aged 12 years and older, hypotension was reported in 2.3% of WEGOVY®-treated patients versus 0% in placebo-treated patients.

Appendicitis

Appendicitis (including perforated appendicitis) occurred in 10 (0.5%) WEGOVY®-treated adult patients and 2 (0.2%) patients receiving placebo.

Gastrointestinal Adverse Reactions

In clinical trials in adults, 73% of WEGOVY®-treated patients and 47% of patients receiving placebo reported gastrointestinal disorders. The most frequently reported reactions were nausea (44% vs. 16%), vomiting (25% vs. 6%), and diarrhea (22% vs. 16%). Other common reactions that occurred at a higher incidence among WEGOVY®-treated adult patients included dyspepsia, abdominal pain, abdominal distension, eructation, flatulence, gastroesophageal reflux disease, gas, and hemorrhoids. These reactions increased during dose escalation.

In a pediatric clinical trial, 62% of WEGOVY®-treated patients and 42% of placebo-treated patients reported gastrointestinal disorders. The most frequently reported reactions were nausea (44% vs. 16%), vomiting (36% vs. 10%), and diarrhea (22% vs. 19%). Other gastrointestinal-related reactions that occurred at a higher incidence than placebo among WEGOVY®-treated pediatric patients included abdominal pain, constipation, eructation, gastrointestinal reflux disease, dyspepsia, and flatulence.

Persistent discontinuation of treatment as a result of a gastrointestinal adverse reaction occurred in 3.4% of WEGOVY®-treated adult patients versus 0.7% of placebo-treated patients. In a pediatric clinical trial, 2.3% of patients treated with WEGOVY® versus 1.5% of patients who received placebo discontinued treatment as a result of gastrointestinal adverse reactions.

Injection Site Reactions

In clinical trials in adults, 1.4% of WEGOVY®-treated patients and 1.0% of patients receiving placebo experienced injection site reactions (including injection site pruritus, erythema, inflammation, induration, and irritation).

Hypersensitivity Reactions

Serious hypersensitivity reactions (e.g., anaphylaxis, angioedema) have been reported with WEGOVY®.

In a pediatric clinical trial, rash was reported in 3% of WEGOVY®-treated patients and 0% of placebo-treated patients, and urticaria was reported in 3% of WEGOVY®-treated patients and 0% of placebo-treated patients. In adult clinical trials, allergic reactions occurred in 0.5% (1% of WEGOVY®) of WEGOVY®-treated patients with anti-semaglutide antibodies and in 114/1659 (7%) of WEGOVY®-treated patients who did not develop anti-semaglutide antibodies (see Clinical Pharmacology [12.6]).

Dysgeusia

In clinical trials in adults, 1.7% of WEGOVY®-treated patients and 0.4% of placebo-treated patients reported dysgeusia.

Laboratory Abnormalities

Amylase and Lipase

Adult and pediatric patients treated with WEGOVY® had a mean increase from baseline in amylase of 15-16% and lipase of 39%.
These changes were not observed in the placebo group. The clinical significance of elevations in lipase or amylase with WEGOVY® is unknown in the absence of other signs and symptoms of pancreatitis.

Liver Enzymes
In a pediatric clinical trial, increases in alanine aminotransferase (ALT) greater than or equal to 5 times the upper limit of normal were observed in 4 (3%) WEGOVY®-treated patients compared with 0% of placebo-treated patients. In some patients, increases in ALT and AST were associated with other confounding factors (such as gallstones).

6.2 Postmarketing Experience
The following adverse reactions have been reported during post-approval use of semaglutide, the active ingredient of WEGOVY®. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Gastrointestinal Disorders: acute pancreatitis and necrotizing pancreatitis, sometimes resulting in death, ileus

Hyperosmosis: anaphylaxis, angioedema, rash, urticaria

Renal and Urinary Disorders: acute kidney injury

7 DRUG INTERACTIONS
7.1 Concomitant Use with an Insulin Secretagogue (e.g., Sulfonylures) or Insulin WEGOVY® lowers blood glucose and can cause hypoglycemia. The risk of hypoglycemia is increased when WEGOVY® is used in combination with insulin secretagogues (e.g., sulfonylures) or insulin. The addition of WEGOVY® in patients treated with insulin has not been evaluated.

When initiating WEGOVY®, consider reducing the dose of concomitantly administered insulin secretagogue (such as sulfonylures) or insulin to reduce the risk of hypoglycemia [see Warnings and Precautions (5.4) and Adverse Reactions (6.1)].

7.2 Oral Medications WEGOVY® causes a delay of gastric emptying and thereby has the potential to impact the absorption of co-administered orally conjugated or marked nutritional products [see Clinical Pharmacology (12.3)]. In clinical pharmacology trials with radiolabeled 1 mg, semaglutide did not affect the absorption of orally administered medications [see Clinical Pharmacology (12.3)]. Nonetheless, monitor the effects of oral medications concomitantly administered with WEGOVY®.

8 USE IN SPECIFIC POPULATIONS
8.1 Pregnancy

Pregnancy Exposure Registry
There will be a pregnancy exposure registry that monitors pregnancy outcomes in women exposed to semaglutide during pregnancy. Pregnant women exposed to WEGOVY® and healthcare providers are encouraged to contact Nono Nordisk at 1-877-390-2769 or www.wegovypregnancyregistry.com.

Risk Summary
Based on animal reproduction studies, there may be potential risks to the fetus from exposure to semaglutide during pregnancy. Additionally, weight loss offers no benefit to a pre-pregnant patient and may cause fetal harm. When a pregnancy is recognized, advise the pregnant patient of the risk to the fetus, and discontinue WEGOVY® [see Clinical Considerations]. Available pharmacovigilance data and data from clinical trials with WEGOVY® use in pregnant patients are insufficient to establish a drug-associated risk of major birth defects, miscarriage or adverse maternal or fetal outcomes. In pregnant rats administered semaglutide during organogenesis, embryofetal mortality, structural abnormalities and alterations to growth occurred at maternal exposures above the maximum recommended human dose (MRHD) based on AUC. In rabbits and cynomolgus monkeys administered semaglutide during organogenesis, early pregnancy losses and structural abnormalities were observed at below the MRHD (rabbit) and greater than or equal to 2-fold the MRHD (monkey). These findings confirm maternal body weight loss in both animal species [see Data]. The estimated background risk of major birth defects and miscarriage for the indicated population are unknown. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2-4% and 15-20%, respectively.

Clinical Considerations

Disease-associated maternal and/or embryo/fetal risk
Appropriate weight gain based on pre-pregnancy weight is currently recommended for all pregnant patients, including those who already have overweight or obesity, because of the obligatory weight gain that occurs in maternal tissues during pregnancy.

Data
Animal Data
In a combined fertility and embryofetal development study in rats, subcutaneous doses of 0.01, 0.03 and 0.09 mg/kg/day (0.04 - 0.1, and 0.4-fold the MRHD) were administered to males for 4 weeks prior to and throughout mating and to females for 2 weeks prior to mating, and throughout organogenesis to Gestation Day 17. In parental animals, pharmacologically mediated reductions in maternal body weight gain and food consumption were observed at all dose levels. In the offspring, reduced growth and fettuses with serious malformations were observed in both heart and skeletal (cranial bones, vertebrae, ribs) abnormalities were observed at the human exposure.

In an embryofetal development study in pregnant rabbits, subcutaneous doses of 0.0010, 0.0025 or 0.0075 mg/kg/day (0.01, 0.01, and 0.09-fold the MRHD) were administered throughout organogenesis from Gestation Day 6 to 19. Pharmacologically mediated reductions in maternal body weight gain and food consumption were observed at all dose levels. Early pregnancy losses and increased incidences of minor visceral (kidney, liver) and skeletal (sternbra) fetal abnormalities were observed at greater than or equal to 0.0205 mg/kg/day, at clinically relevant exposure levels.

In an embryofetal development study in pregnant cynomolagus monkeys, subcutaneous doses of 0.015, 0.075, and 0.15 mg/kg twice weekly (0.4, - 2, and 6-fold the MRHD) were administered throughout organogenesis, from Gestation Day 16 to 50. Pharmacologically mediated, marked initial maternal body weight loss and reductions in body weight gain and food consumption coincided with the occurrence of sporadic abnormalities (vertebra, sternbra, ribs) at greater than or equal to 0.075 mg/kg twice weekly (greater than or equal to 2 times human exposure).

In a pre- and postnatal study development in pregnant cynomolgous monkeys, subcutaneous doses of 0.015, 0.075, and 0.15 mg/kg twice weekly (0.2, - 1, and 3-fold the MRHD) were administered from Gestation Day 16 to 140. Pharmacologically mediated marked initial maternal body weight loss and reductions in body weight gain and food consumption coincided with an increase in early pregnancy losses and led to delivery of slightly smaller offspring at greater than or equal to 0.075 mg/kg twice weekly (greater than or equal to 1 time human exposure).

8.2 Lactation

Risk Summary
There are no data on the presence of semaglutide or its metabolites in human milk, the effects on the breastfed infant or the effects on milk production. Semaglutide was present in the milk of lactating rats. When a drug is present in animal milk, it is likely that the drug will be present in human milk [see Data]. The developmental and health benefits of breastfeeding should be considered along with the mother’s clinical need for WEGOVY® and any potential adverse effects on the breastfed infant from WEGOVY® or from the underlying maternal condition.

Data
In lactating rats, semaglutide was detected in milk at levels 3-12 fold lower than in maternal plasma.

8.3 Females and Males of Reproductive Potential
Because of the potential for fetal harm, discontinue WEGOVY® in patients at least 2 months before they plan to become pregnant to account for the long half-life of semaglutide [see Use in Specific Populations (8.1)].

8.4 Pediatric Use

Safety and effectivenss of WEGOVY® as an adjunct to a reduced calorie diet and increased physical activity for chronic weight management have been established in pediatric patients aged 12 years and older with a BMI corresponding to ≥95th percentile standardized for age and sex. Use of WEGOVY® for this indication is supported by a 68-week, double-blind, placebo-controlled clinical trial in 201 pediatric patients aged 12 years and older with a BMI corresponding to ≥95th percentile for age and sex and from studies in adult patients with obesity [see Clinical Studies (14.2)].

Adverse reactions with WEGOVY® treatment in pediatric patients aged 12 years and older were similar to those reported in adults. Pediatric patients aged 12 years and older treated with WEGOVY® had greater incidences of cholecystitis, hyperemesis, rash, and urticaria compared to adults treated with WEGOVY® [see Adverse Reactions (6.1)].

There are insufficient data in pediatric patients with type 2 diabetes treated with WEGOVY® for obesity to determine if there is an increased risk of hypoglycemia with WEGOVY® treatment similar to that reported in adults. Inform patients of the risk of hypoglycemia and educate them on the signs and symptoms of hypoglycemia. In pediatric patients aged 12 years and older with type 2 diabetes, monitor blood glucose prior to starting WEGOVY® and during WEGOVY® treatment. When initiating WEGOVY® in pediatric patients aged 12 years and older with type 2 diabetes, consider reducing the dose of concomitantly administered insulin secretagogue (such as sulfonylures) or insulin to reduce the risk of hypoglycemia [see Warnings and Precautions (5.4)].

The safety and effectiveness of WEGOVY® have not been established in pediatric patients less than 12 years of age.

8.5 Geriatric Use

In the WEGOVY® clinical trials, 233 (9%) WEGOVY®-treated patients were between 65 and 75 years of age and 23 (1%) WEGOVY®-treated patients were 75 years of age and over [see Clinical Studies (14.1)]. No overall differences in safety or effectiveness have been observed between patients 65 years of age and older and younger adult patients.

8.6 Renal Impairment

No dose adjustment of WEGOVY® is recommended for patients with renal impairment. In a study in patients with renal impairment, including end-stage renal disease, no clinically relevant change in semaglutide pharmacokinetics was observed [see Clinical Pharmacology (12.3)].

8.7 Hepatic Impairment

No dose adjustment of WEGOVY® is recommended for patients with hepatic impairment. In a study in patients with different degrees of hepatic impairment, no clinically relevant change in semaglutide pharmacokinetics was observed [see Clinical Pharmacology (12.3)].

10 OVERDOSAGE

Overdoses have been reported with other GLP-1 receptor agonists. Effects have included severe nausea, severe vomiting, and severe hypoglycemia. In the event of overdose, appropriate supportive treatment should be initiated according to the patient’s clinical signs and symptoms. In the event of an overdose of WEGOVY®, consider contacting the Poison Help line (1-800-222-1222) or a medical toxicologist for additional overdose management recommendations. A prolonged period of observation and treatment for these symptoms may be necessary, taking into account the long half-life of WEGOVY® of approximately 1 week.

11 DESCRIPTION

WEGOVY® (semaglutide) injection, for subcutaneous use, contains semaglutide, a human GLP-1 receptor agonist (or GLP-1 analog). The peptide backbone is produced by yeast fermentation. The main protraction mechanism of semaglutide is albumin binding, facilitated by modification of position 26 lysine with a hydrophilic spacer and a C18 fatty di-acid. Furthermore, semaglutide is modified in position 8 to provide stabilization against degradation by the enzyme dipeptidyl-peptidase 4 (DPP-4). A minor modification was made in position 34 to ensure the attachment of only one fatty di-acid. The chemical formula is C291H292N292O132 and the molecular weight is 4113.58 g/mol.

Figure 1. Structural Formula of semaglutide
The potential effect of semaglutide Wegovy® (semaglutide) injection 2.4 mg max 2: maximum concentration, CI: confidence interval.

## 12 CLINICAL PHARMACOLOGY

### 12.1 Mechanism of Action
Semaglutide is a GLP-1 analogue with 94% sequence homology to human GLP-1. Semaglutide acts as a GLP-1 receptor agonist that selectively binds to and activates the GLP-1 receptor, the target for native GLP-1. GLP-1 is a physiological regulator of appetite and caloric intake, and the GLP-1 receptor is present in several areas of the brain involved in appetite regulation. Animal studies show that semaglutide distributed to and activated neurons in brain regions involved in regulation of food intake.

Cardiac electrophysiology (QTc)
The effect of semaglutide on cardiac repolarization was tested in a thorough QTc trial. Semaglutide did not prolong QTc intervals at doses up to 1.5 mg at steady state.

### 12.2 Pharmacodynamics
Semaglutide lowers body weight through decreased calorie intake. The effects are likely mediated by affecting appetite.

Semaglutide stimulates insulin secretion and reduces glucagon secretion in a glucose-dependent manner. These effects can lead to a reduction of blood glucose.

### 12.3 Pharmacokinetics

#### Absorption
Absolute bioavailability of semaglutide is 89%. Maximum concentration of semaglutide is reached 1 to 3 days post dose.

Similar exposure was achieved with subcutaneous administration of semaglutide in the abdomen, thigh, or upper arm.

The average semaglutide steady state concentration following subcutaneous administration of WEGOVY® was approximately 75 mmol/L in patients with either obesity (BMI) greater than or equal to 30 kg/m² or overweight (BMI greater than or equal to 27 kg/m²). The steady state exposure of WEGOVY® increased proportionally with doses up to 2.4 mg once-weekly.

#### Distribution
The mean volume of distribution following subcutaneous administration in patients with obesity or overweight is approximately 12.5 L. Semaglutide is extensively bound to plasma albumin (greater than 99%) which results in decreased renal clearance and protection from degradation.

#### Elimination
The apparent clearance of semaglutide in patients with obesity or overweight is approximately 0.05 L/h. With an elimination half-life of approximately 1 week, semaglutide will be present in the circulation for about 5 to 7 weeks after the last dose of 2.4 mg.

#### Metabolism
The primary route of elimination for semaglutide is metabolism following proteolytic cleavage of the peptide backbone and subsequent beta-oxidation of the fatty acid sidechain.

#### Excretion
The primary excretion routes of semaglutide-related material are via the urine and feces. Approximately 3% of the dose is excreted in the urine as intact semaglutide.

### Specific Populations

#### Intrinsic Factors
The effects of intrinsic factors on the pharmacokinetics of semaglutide are shown in Figure 2.

### Figure 2. Impact of intrinsic factors on semaglutide exposure

#### Intrinsic Factor

Data are steady-state dose-normalized average semaglutide exposures relative to a reference subject profile (non-Hispanic or Latino ethnicity, white female aged 18 to less than 65 years, with a body weight of 110 kg and normal renal function, who injected in the abdomen). Body weight categories (74 and 143 kg) represent the 5% and 95% percentiles in the dataset.

### 12.6 Immunogenicity
The observed incidence of anti-drug antibodies is highly dependent on the sensitivity and specificity of the assay. Differences in assay methods preclude meaningful comparisons of the incidence of anti-drug antibodies in the studies described below with the incidence of anti-drug antibodies in other studies, including those of semaglutide or other semaglutide products.

During the 68-week treatment periods in Studies 1 and 2 and [see Clinical Studies (14.1)](111), 50(1793) (3%) of WEGOVY®-treated patients developed anti-semaglutide antibodies. Of these 50 WEGOVY®-treated patients, 28 patients (2% of the total WEGOVY®-treated study population) developed antibodies that cross-reacted with native GLP-1. No identified clinically significant effect of anti-semaglutide antibodies on pharmacokinetics for WEGOVY® was observed. There is insufficient evidence to characterize the effects of anti-semaglutide antibodies on pharmacodynamics or effectiveness of semaglutide.

### 13 NONCLINICAL TOXICOLOGY

#### 13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility
In a 2-year carcinogenicity study in CD-1 mice, subcutaneous doses of 0.3, 1 and 3 mg/kg/day (2-, 6-, and 22-fold the maximum recommended human dose [MRHD]) of 2.4 mg/week, based on AUC) were administered to the males, and 0.1, 0.3 and 1 mg/kg/day (0.6-, 2- and 5-fold MRHD) were administered to the females. A statistically significant increase in thyroid C-cell adenomas and a numerical increase in C-cell carcinomas were observed in males and females at all dose levels (greater than or equal to 0.6 times human exposure).

In a 2-year carcinogenicity study in Sprague Dawley rats, subcutaneous doses of 0.0025, 0.01, 0.025 and 0.1 mg/kg/day were administered (below quantification, 0.2-, 0.4-, and 2-fold the exposure at the MRHD). A statistically significant increase in thyroid C-cell adenomas was observed in males and females at all dose levels, and a statistically significant increase in thyroid C-cell carcinomas was observed in males at greater than or equal to 0.01 mg/kg/day, at clinically relevant exposures. Human relevance of thyroid C-cell tumors in rats is unknown and could not be determined by clinical studies or nonclinical studies [see Boxed Warning and Warnings and Precautions (5.1)].

Semaglutide was not mutagenic or clastogenic in a standard battery of genotoxicity tests (bacterial mutagenicity [Ames], human lymphocyte chromosomal aberration, rat bone marrow micronucleus).

#### 13.2 Reproduction Studies
In a combined fertility and embryo-fetal development study in rats, subcutaneous doses of 0.01, 0.03 and 0.09 mg/kg/day (0.04-, 0.1- and 0.4-fold the MRHD) were administered to male and female rats. Male and female rats were dosed for 2 weeks prior to mating, and females were dosed for 2 weeks prior to mating and throughout organogenesis until Gestation Day 17. No effects were observed on male fertility. In females, an increase in estrus cycle length was observed at all dose levels, together with a small reduction in numbers of corpora lutea at greater than or equal to 0.03 mg/kg/day. These effects were likely an adaptive response secondary to the pharmacological effect of semaglutide on food consumption and body weight.

### 14 CLINICAL STUDIES

#### 14.1 Weight Management Studies in Adults with Overweight or Obesity
Overview of Clinical Studies in Adults
The safety and efficacy of WEGOVY® for chronic weight management (weight loss and maintenance) in conjunction with a reduced calorie diet and increased physical activity were studied in three 68-week, randomized, double-blind, placebo-controlled trials, one 68-week, randomized, double-blind, placebo withdrawal trial, and one 68-week, randomized, double-blind trial that investigated 2 different doses of WEGOVY® versus placebo. In Studies 1, 2, and 3, WEGOVY® or matching placebo was escalated to 2.4 mg subcutaneous weekly during a 16-week period followed by 52 weeks on maintenance dose. In Study 4, WEGOVY® was escalated during a 20-week run-in period, and patients...
who reached WEGOVY® 2.4 mg after the run-in period were randomized to either continued treatment with WEGOVY® or placebo for 48 weeks. In Study 5, WEGOVY® was escalated to 1.7 mg or 2.4 mg or placebo over 12 to 16 weeks followed by 52 weeks on either maintenance dose. In Studies 1, 2, and 4, all patients received instruction for a reduced calorie diet (approximately 500 kcal/day deficit) and increased physical activity counseling (recommended to a minimum of 150 min/week) that began with the first dose of study medication or placebo and continued throughout the trial. In Study 3, patients received an initial 8-week low-calorie diet (total energy intake 1000 to 1200 kcal/day) followed by 60 weeks of a reduced calorie diet (1200-1800 kcal/day) and increased physical activity (100 min/week) with gradual increase to 200 min/week.

Study 1 was a 68-week trial that enrolled 1961 patients with obesity (BMI greater than or equal to 30 kg/m²) or with overweight (BMI 27-29.9 kg/m²) and at least one weight-related comorbid condition, such as treated or untreated dyslipidemia or hypertension, patients with type 2 diabetes mellitus were excluded. Patients were randomized in a 2:1 ratio either to WEGOVY® or placebo. At baseline, mean age was 46 years (range 18-66), 74.1% were women, 75.1% were White, 13.3% were Asian and 5.7% were Black or African American, at total of 12.0% were Hispanic or Latino ethnicity. Mean baseline body weight was 105.3 kg and mean BMI was 37.9 kg/m².

Study 2 was a 66-week trial that enrolled 807 patients with type 2 diabetes and BMI greater than or equal to 27 kg/m². Patients included in the trial had HbA1c 7-10% and were treated with either: diet and exercise alone or 1 to 3 oral anti-diabetic drugs (metformin, sulfonylurea, glitazone or sodium/glucose transporter-2 inhibitor). Patients were randomized in a 1:1 ratio to receive either WEGOVY® or placebo. At baseline, the mean age was 55 years (range 19-84), 50.9% were women, 61.2% were White, 26.2% were Asian and 8.3% were Black or African American. A total of 12.8% were Hispanic or Latino ethnicity. Mean baseline body weight was 99.8 kg and mean BMI was 35.7 kg/m².

Study 3 was a 68-week trial that enrolled 611 patients with obesity (BMI greater than or equal to 30 kg/m²) or with overweight (BMI 27-29.9 kg/m²) and at least one weight-related comorbid condition such as treated or untreated dyslipidemia or hypertension, patients with type 2 diabetes mellitus were excluded. The patients were randomized in a 2:1 ratio to receive either WEGOVY® or placebo. At baseline, the mean age was 46 years, 81.0% were women, 76.1% were White, 19.0% were Black or African American, and 18.8% were Asian or other ethnicities. A total of 12.8% were Hispanic or Latino ethnicity. Mean baseline body weight was 105.8 kg and mean BMI was 38.5 kg/m².

Study 4 was a 66-week trial that enrolled 902 patients with obesity (BMI greater than or equal to 30 kg/m²) or with overweight (BMI 27-29.9 kg/m²) and at least one weight-related comorbid condition such as treated or untreated dyslipidemia or hypertension, patients with type 2 diabetes mellitus were excluded. Mean body weight at baseline for the 902 patients was 106.8 kg and mean BMI was 38.3 kg/m². All patients received WEGOVY® during the run-in period of 20 weeks that included 16 weeks of dose escalation. Trial product was permanently discontinued before randomization in 99 of 902 patients (11%); the most common reason was adverse reactions (n=48, 5.3%); 803 patients were randomized to WEGOVY® and 299 patients were randomized to placebo, respectively. Missing data was imputed from retrieved subjects of the same randomized treatment arm (RO-MI).

Study 5 was a 68-week trial that enrolled 401 East-Asian patients (Japan and South Korea) with BMI greater than or equal to 27 kg/m² or with overweight (BMI 27-34.9 kg/m²) and at least two weight-related comorbid conditions. The patients were randomized 2:1:1 to receive WEGOVY® 2.4 mg, WEGOVY® 1.7 mg, or placebo. At baseline, the mean age was 51 years, 63.1% were men, and all patients were Asian. Mean baseline body weight was 87.5 kg and mean BMI was 27.9 kg/m². At baseline, 24.7% of patients had type 2 diabetes mellitus.

For Study 3, the primary efficacy parameter was mean percent change in body weight from randomization (week 20) to week 68. From randomization (week 20) to week 68, treatment with WEGOVY® resulted in a statistically significant reduction in body weight compared with placebo (Table 8). Because patients who discontinued WEGOVY® during titration and those who did not reach the 2.4 mg weekly dose were not eligible for the randomized treatment period, the results may not reflect the experience of patients in the general population who are first starting WEGOVY®.

For Study 5, the primary efficacy parameters were mean percent change in body weight and the percentage of patients achieving greater than or equal to 5% weight loss from baseline to week 68. After 68 weeks, treatment with WEGOVY® 1.7 mg and 2.4 mg resulted in a statistically significant reduction in body weight compared with placebo. Greater proportions of patients treated with WEGOVY® achieved 5%, 10%, and 15% weight loss than those treated with placebo as shown in Table 9.

LSMean = least squares mean; CI = confidence interval

*The intent-to-treat population includes all randomized patients. At baseline, 24.7% of patients had type 2 diabetes mellitus. At week 68, the body weight was missing for 5%, 3%, and 1% of patients randomized to WEGOVY® 1.7 mg, WEGOVY® 2.4 mg, and placebo, respectively. Missing data were imputed from retrieved subjects of the same randomized treatment arm (RD-MI).

*p<0.0001 (unadjusted 2-sided) for superiority.

A reduction in body weight was observed with WEGOVY® irrespective of age, sex, race, ethnicity, BMI at baseline, body weight (kg) at baseline, and level of renal function impairment. The cumulative frequency distributions of change in body weight are shown in Figure 4 and Figure 5 for Studies 1 and 2. One way to interpret this figure is to select a change in body weight of interest on the horizontal axis and note the corresponding proportions of patients (vertical axis) in each treatment group who achieved at least that degree of weight loss. For example, note that the vertical line arising from -10% in Study 1 intersects the WEGOVY® curves at approximately 66%, and 12%, respectively, which correspond to the values shown in Table 7.

Figure 4. Change in body weight (%) from baseline to week 68 (Study 1)

Figure 5. Change in body weight (%) from baseline to week 68 (Study 2)

Observed data from in-trial period including imputed data for missing observations (RD-MI).

The time courses of weight loss with WEGOVY® and placebo from baseline through week 68 are depicted in Figure 6, Figure 7 and Figure 8.

Figure 6. Change from baseline (%) in body weight (Study 1 on left and Study 2 on right)

Figure 7. Change from baseline (%) in body weight (Study 3 on left and Study 4 on right)

Observed values for patients completing each scheduled visit, and estimates with multiple imputations from retrieved dropouts (RD-MI).

Figure 8. Change in body weight (%) from baseline to week 68 (Study 5 in East-Asian Patients)

Observed values for patients completing each scheduled visit and estimates with multiple imputations from retrieved dropouts (RD-MI). At baseline, 24.7% of patients had type 2 diabetes mellitus.
Effect of WEGOVY® on Anthropometry and Cardiometabolic Parameters in Adults

Changes in waist circumference and cardiometabolic parameters with WEGOVY® are shown in Table 10 for Studies 1, 2, and 3, in Table 11 for Study 4; and in Table 12 for Study 5.

### 14.2 Weight Management Study in Pediatric Patients Aged 12 Years and Older with Obesity

#### Overview of Clinical Trial in Pediatric Patients

WEGOVY® was evaluated in a 68-week, double-blind, randomized, parallel group, placebo-controlled, multi-center trial in 201 pubertal pediatric patients aged 12 years and older with BMI corresponding to ≥95th percentile standardized for age and sex [see Dosage and Administration (2.1)]. After a 12-week lifestyle run-in period (including dietary recommendations and physical activity counseling), patients were randomized 2:1 to WEGOVY® or matching placebo, respectively.

#### Results

The primary endpoint was percent change in BMI from baseline to week 68. After 62 weeks, treatment with WEGOVY® resulted in a statistically significant reduction in percent BMI when compared with placebo. The mean age of the patients was 15 years; 38% were male; 79% were White, 8% were Black or African American, 2% were Asian, and 11% were of other or unknown race; and 11% were of Hispanic or Latino ethnicity. The mean baseline body weight was 108 kg, and mean BMI was 37 kg/m².

The proportions of patients who discontinued study drug were 10% for the WEGOVY®-treated group and 10% for the placebo-treated group.

*LSMean = least squares mean; CI = confidence interval

aThe intention-to-treat population includes all randomized patients. Missing data were imputed using available data according to value and timing of last available observation on treatment and endpoint's baseline value from retrieved subjects (RD-MI). At week 68, the BMI was missing for 2.2% and 7.5% of patients randomized to WEGOVY® and placebo, respectively.

bParameters not included in the pre-specified hierarchical testing.

cp<0.0001 (unadjusted 2-sided) for superiority.

¹Parameters listed in the table were not included in the pre-specified hierarchical testing.
²Missing data were imputed using available data according to value and timing of last available observation on treatment and endpoint's baseline value from retrieved subjects (RD-MI). Model based estimates based on an analysis of covariance model including treatment and stratification groups (gender, Tanner stage group) and the interaction between stratification groups as factors and baseline value as a covariate.
³Model based estimates based on a mixed model for repeated measures including treatment as a factor and baseline value as a covariate.
⁴For patients without type 2 diabetes at randomization (N=629 for WEGOVY®-treated patients and N=64 for placebo-treated patients).
⁵Baseline value is the geometric mean.

14.3 Cardiovascular Outcomes Trial of Semaglutide 0.5 mg and 1 mg in Adult Patients with Type 2 Diabetes and Cardiovascular Disease

Semaglutide 0.5 mg and 1 mg (OZEMPIC®) are used in the treatment of type 2 diabetes mellitus in adults. The efficacy of semaglutide at doses of 0.5 mg and 1 mg have not been established for chronic weight management.

SUSTAIN 6 was a 104-week, double-blind trial in which 3297 patients with type 2 diabetes and atherosclerotic cardiovascular disease were randomized to semaglutide 0.5 mg once-weekly, semaglutide 1 mg once-weekly, or placebo in addition to standard-of-care for a median study observation time of 2.1 years. In total, 2,735 (83%) of the patients had a history of cardiovascular disease and 562 (17%) were at high risk but without known cardiovascular disease. The mean age at baseline was 65 years, and 61% were men. Overall, 83% were White, 7% were Black or African American, and 8% were Asian. A total of 16% were identified as Hispanic or Latino ethnicity.

In total, 98.0% of the patients completed the trial and the vital status was known at the end of the trial for 99.6%. The primary composite endpoint was the time from randomization to first occurrence of a major adverse cardiac event (MACE): cardiovascular death, non-fatal myocardial infarction or non-fatal stroke. The total number of primary component MACE endpoints was 254 (108 [6.6%] with semaglutide and 146 [8.9%] with placebo). No total number of primary component MACE endpoints was known at the end of the trial for 99.6%. The primary composite endpoint was determined using a per-protocol analysis and considered to be significant at a p value of 0.025.

16 HOW SUPPLIED/STORAGE AND HANDLING

How Supplied

WEGOVY® injection is a clear, colorless solution in a pre-filled, disposable, single-dose pen-injector with an integrated needle. It is supplied in cartons containing 4 pen-injectors in the following packaging configurations:

<table>
<thead>
<tr>
<th>Total Strength per Total Volume</th>
<th>NDC</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.25 mg/0.5 mL</td>
<td>0169-4525-14</td>
</tr>
<tr>
<td>0.5 mg/0.5 mL</td>
<td>0169-4505-14</td>
</tr>
<tr>
<td>1.0 mg/0.5 mL</td>
<td>0169-4501-14</td>
</tr>
<tr>
<td>1.7 mg/0.75 mL</td>
<td>0169-4517-14</td>
</tr>
<tr>
<td>2.4 mg/0.75 mL</td>
<td>0169-4524-14</td>
</tr>
</tbody>
</table>

Recommended Storage

Store the WEGOVY® single-dose pen in the refrigerator from 2°C to 8°C (36°F to 46°F). If needed, prior to cap removal, the pen can be kept from 8°C to 30°C (46°F to 86°F) up to 28 days. Do not freeze. Protect WEGOVY® from light. WEGOVY® must be kept in the original carton until time of administration. Discard the WEGOVY® pen after use.

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Medication Guide and Instructions for Use).

Risk of Thyroid C-cell Tumors

Inform patients that semaglutide causes thyroid C-cell tumors in rodents and that the human relevance of this finding has not been determined. Counsel patients to report symptoms of thyroid tumors (e.g., a lump in the neck, hoarseness, dysphasia, or dyspnea) to their physician [see Boxed Warning and Warnings and Precautions (5.1)].

Acute Pancreatitis

Inform patients of the potential risk for acute pancreatitis. Instruct patients to discontinue WEGOVY® promptly and contact their physician if pancreatitis is suspected (severe abdominal pain that may radiate to the back, and which may or may not be accompanied by vomiting) [see Warnings and Precautions (5.2)].

Acute Gallbladder Disease

Inform patients of the risk of acute gallbladder disease. Advise patients that substantial or rapid weight loss can increase the risk of gallbladder disease, but that gallbladder disease may also occur in the absence of substantial or rapid weight loss. Instruct patients to contact their healthcare provider for appropriate clinical follow-up if gallbladder disease is suspected [see Warnings and Precautions (5.3)].

Hypoglycemia

Inform patients of the risk of hypoglycemia and educate patients on the signs and symptoms of hypoglycemia. Advise patients with type 2 diabetes mellitus on glycemic lowering therapy that they may have an increased risk of hypoglycemia when using WEGOVY® and to report signs and/or symptoms of hypoglycemia to their healthcare provider [see Warnings and Precautions (5.4)].

Dehydration and Renal Impairment

Advise patients treated with WEGOVY® of the potential risk of dehydration due to gastrointestinal adverse reactions and take precautions to avoid fluid depletion. Inform patients of the potential risk for worsening renal function and explain the associated signs and symptoms of renal impairment, as well as the possibility of dialysis as a medical intervention if renal failure occurs [see Warnings and Precautions (5.5)].

Hypersensitivity Reactions

Inform patients that serious hypersensitivity reactions have been reported during postmarketing use of semaglutide, the active ingredient in WEGOVY®. Advise patients on the symptoms of hypersensitivity reactions and instruct them to stop taking WEGOVY® and seek medical advice promptly if such symptoms occur [see Warnings and Precautions (5.6)].

Diabetic Retinopathy Complications in Patients with Type 2 Diabetes

Inform patients with type 2 diabetes to contact their physician if changes in vision are experienced during treatment with WEGOVY® [see Warnings and Precautions (5.7)].

Heart Rate Increase

Instruct patients to inform their healthcare providers of palpitations or feelings of a racing heartbeat while at rest during WEGOVY® treatment [see Warnings and Precautions (5.8)].

Suicidal Behavior and Ideation

Advise patients to report emergence or worsening of depression, suicidal thoughts or behavior, and/or any unusual changes in mood or behavior. Inform patients that if they experience suicidal thoughts or behaviors, they should stop taking WEGOVY® [see Warnings and Precautions (5.9)].

Pregnancy

WEGOVY® may cause fetal harm. Advise patients to inform their healthcare provider of a known or suspected pregnancy.

Read this Medication Guide and Instructions for Use before you start using WEGOVY® and each time you get a refill. There may be new information. This information does not take the place of talking to your healthcare provider about your medical condition or your treatment.

What is the most important information I should know about WEGOVY®?

WEGOVY® may cause serious side effects, including:
- Possible thyroid tumors, including cancer. Tell your healthcare provider if you get a lump or swelling in your neck, hoarseness, trouble swallowing, or shortness of breath. These may be symptoms of thyroid cancer. In studies with rodents, WEGOVY® and medicines that work like WEGOVY® caused thyroid tumors, including thyroid cancer. It is not known if WEGOVY® will cause thyroid tumors or a type of thyroid cancer called medullary thyroid carcinoma (MTC) in people.
- Do not use WEGOVY® if you or any of your family have ever had a type of thyroid cancer called medullary thyroid carcinoma (MTC), or if you have an endocrine system condition called Multiple Endocrine Neoplasia syndrome type 2 ( MEN 2).

What is WEGOVY®?

WEGOVY® is an injectable prescription medicine that may help adults and children aged 12 years and older with obesity, or some adults with excess weight (overweight) who also have weight-related medical problems to help them lose weight and keep the weight off.
- WEGOVY® should be used with a reduced calorie meal plan and increased physical activity.
- WEGOVY® contains semaglutide and should not be used with other semaglutide-containing products or other GLP-1 receptor agonist medicines.
- It is not known if WEGOVY® is safe and effective when taken with other prescription, over-the-counter, or herbal weight loss products.
- It is not known if WEGOVY® can be used safely in people with a history of pancreatitis.
- It is not known if WEGOVY® is safe and effective for use in children under 12 years of age.

Do not use WEGOVY® if:

- you or any of your family have ever had a type of thyroid cancer called medullary thyroid carcinoma (MTC) or if you have an endocrine system condition called Multiple Endocrine Neoplasia syndrome type 2 ( MEN 2).
- you have had a serious allergic reaction to semaglutide or any of the ingredients in WEGOVY®. See the end of this Medication Guide for a complete list of ingredients in WEGOVY®.
- Symptoms of a serious allergic reaction include:
  - swelling of your face, lips, tongue or throat
  - fainting or feeling dizzy
  - problems breathing or swallowing
  - very rapid heartbeat
  - severe rash or itching

Before using WEGOVY®, tell your healthcare provider if you have any other medical conditions, including if you:
- have or have had problems with your pancreas or kidneys.
- have type 2 diabetes and a history of diabetic retinopathy.
- have or have had depression or suicidal thoughts, or mental health issues.
- are pregnant or plan to become pregnant. WEGOVY® may harm your unborn baby. You should stop using WEGOVY® 2 months before you plan to become pregnant.
- Pregnancy Exposure Registry: There is a pregnancy exposure registry for women who use WEGOVY® during pregnancy. The purpose of this registry is to collect information about the health of you and your baby. Talk to your healthcare provider about how you can take part in this registry or you may contact Novo Nordisk at 1-877-390-2760.
- are breastfeeding or plan to breastfeed. It is not known if WEGOVY® passes into your breast milk. You should talk with your healthcare provider about the best way to feed your baby while using WEGOVY®.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements. WEGOVY® may affect the way some medicines work and some medicines may affect the way WEGOVY® works. Tell your healthcare provider if you are taking other medicines to treat diabetes, including sulfonylureas or insulin. WEGOVY® slows stomach emptying and can affect medicines that need to pass through the stomach quickly.

Know the medicines you take. Keep a list of them to show your healthcare provider and pharmacist when you get a new medicine.

How should I use WEGOVY®?

- Read the Instructions for Use that comes with WEGOVY®.
- Use WEGOVY® exactly as your healthcare provider tells you to.
- Your healthcare provider should show you how to use WEGOVY® before you use it for the first time.
- WEGOVY® is injected under the skin (subcutaneously) of your stomach (abdomen), thigh, or upper arm. Do not inject WEGOVY® into a muscle (intramuscularly) or vein (intravenously).
- Change (rotate) your injection site with each injection. Do not use the same site for each injection.
- Use WEGOVY® 1 time each week, on the same day each week, at any time of the day.
- Start WEGOVY® with 0.25 mg per week in your first month. In your second month, increase your weekly dose to 0.5 mg. In the third month, increase your weekly dose to 1 mg. In the fourth month, increase your weekly dose to 1.7 mg. In the fifth month onwards, your healthcare provider may either maintain your dose at 1.7 mg weekly or increase your weekly dose to 2.4 mg.
- If you need to change the day of the week, you may do so as long as your last dose of WEGOVY® was given 2 or more days before.
- If you miss a dose of WEGOVY® and the next scheduled dose is more than 2 days away (48 hours), take the missed dose as soon as possible. If you miss a dose of WEGOVY® and the next scheduled dose is less than 2 days away (48 hours), do not administer the dose. Take your next dose on the regularly scheduled day.
- If you miss doses of WEGOVY® for more than 2 weeks, take your next dose on the regularly scheduled day or call your healthcare provider to talk about how to restart your treatment.
- You can take WEGOVY® with or without food.
- If you take too much WEGOVY®, you may have severe nausea, severe vomiting and low blood sugar. Call your healthcare provider or go to the nearest hospital emergency room right away if you experience any of these symptoms.

What are the possible side effects of WEGOVY®?

WEGOVY® may cause serious side effects, including:
- See “What is the most important information I should know about WEGOVY®?”
- inflammation of your pancreas (pancreatitis). Stop using WEGOVY® and call your healthcare provider right away if you have severe pain in your stomach area (abdomen) that will not go away, with or without vomiting. You may feel the pain from your abdomen to your back.
- gallbladder problems. WEGOVY® may cause gallbladder problems including gallstones. Some gallbladder problems need surgery. Call your healthcare provider if you have any of the following symptoms:
  - pain in your upper stomach (abdomen)
  - yellowing of skin or eyes (jaundice)
  - clay-colored stools
- increased risk of low blood sugar (hypoglycemia) in patients with type 2 diabetes, especially those who also take medicines to treat type 2 diabetes mellitus such as sulfonylureas or insulin. Low blood sugar in patients with type 2 diabetes who receive WEGOVY® can be both a serious and common side effect. Talk to your healthcare provider about how to recognize and treat low blood sugar. You should check your blood sugar before you start taking WEGOVY® and while you take WEGOVY®. Signs and symptoms of low blood sugar may include:
  - dizziness or light-headedness
  - blurred vision
  - anxiety
  - irritability or mood changes
  - fast heartbeat
  - feeling jittery
  - kidney problems (kidney failure). In people who have kidney problems, diarrhea, nausea, and vomiting may cause a loss of fluids (dehydration) which may cause kidney problems to get worse. It is important for you to drink fluids to help reduce your chance of dehydration.
  - serious allergic reactions. Stop using WEGOVY® and get medical help right away, if you have any symptoms of a serious allergic reaction including:
    - swelling of your face, lips, tongue or throat
    - severe rash or itching
    - problems breathing or swallowing
    - very rapid heartbeat
    - fainting or feeling dizzy
- change in vision in people with type 2 diabetes. Tell your healthcare provider if you have changes in vision during treatment with WEGOVY®.
- increased heart rate. WEGOVY® can increase your heart rate while you are at rest. Your healthcare provider should check your heart rate while you take WEGOVY®. Tell your healthcare provider if you feel your heart racing or pounding in your chest and it lasts for several minutes.
- depression or thoughts of suicide. You should pay attention to any mental changes, especially sudden changes in your mood, behaviors, thoughts, or feelings. Call your healthcare provider right away if you have any mental changes that are new, worse, or worry you.

The most common side effects of WEGOVY® in adults and children aged 12 years and older may include:
- headache
- diarrhea
- vomiting
- constipation
- stomach (abdomen) pain
- dizziness
- nausea
- runny nose or sore throat
- weakened muscle
- increased appetite
- cold or flu symptoms
- shortness of breath
- constipation
- upset stomach
- gas

Talk to your healthcare provider about any side effect that bothers you or does not go away. These are not all the possible side effects of WEGOVY®.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.
General information about the safe and effective use of WEGOVY®.
Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use WEGOVY® for a condition for which it was not prescribed. Do not give WEGOVY® to other people, even if they have the same symptoms that you have. It may harm them. You can ask your pharmacist or healthcare provider for information about WEGOVY® that is written for health professionals.

What are the ingredients in WEGOVY®?
Active Ingredient: semaglutide
Inactive Ingredients: disodium phosphate dihydrate, 1.42 mg; sodium chloride, 8.25 mg; water for injection; and hydrochloric acid or sodium hydroxide may be added to adjust pH.

This Medication Guide has been approved by the U.S. Food and Drug Administration.
Issued: 07/2023
Instructions for Use
WEGOVY®
(semaglutide) injection

WEGOVY® comes in five strengths:

- 0.25 mg / 0.5 mL
- 0.5 mg / 0.5 mL
- 1 mg / 0.5 mL
- 1.7 mg / 0.75 mL
- 2.4 mg / 0.75 mL

Before you use your WEGOVY® pen for the first time, talk to your healthcare provider or your caregiver about how to prepare and inject WEGOVY® correctly.

Important information
Read these Instructions for Use before you start using WEGOVY®. This information does not replace talking to your healthcare provider about your medical condition or treatment.

- Your WEGOVY® pen is for 1 time use only. The WEGOVY® pen is for subcutaneous (under the skin) use only.
- The dose of WEGOVY® is already set on your pen.
- The needle is covered by the needle cover and the needle will not be seen.
- Do not remove the pen cap until you are ready to inject.
- Do not touch or push on the needle cover. You could get a needle stick injury.
- Your WEGOVY® injection will start when the needle cover is pressed firmly against your skin.
- Do not remove the pen from your skin before the yellow bar in the pen window has stopped moving. The medicine may appear on the skin or squirt from the needle and you may not get your full dose of WEGOVY® if:
  - the pen is removed too early or
  - you have not pressed the pen firmly against the skin for the entire injection.
- If the yellow bar does not start moving or stops during the injection, contact your healthcare provider or Novo Nordisk at startWegovy.com or call Novo Nordisk Inc. at 1-833-934-6891.
- The needle cover will lock when the pen is removed from your skin. You cannot stop the injection and restart it later.
- People who are blind or have vision problems should not use the WEGOVY® pen without help from a person trained to use the WEGOVY® pen.

How do I store WEGOVY®?
- Store the WEGOVY® pen in the refrigerator between 36°F to 46°F (2°C to 8°C).
- If needed, before removing the pen cap, WEGOVY® can be stored from 46°F to 86°F (8°C to 30°C) in the original carton for up to 28 days.
- Keep WEGOVY® in the original carton to protect it from light.
- Do not freeze.
- Throw away the pen if WEGOVY® has been frozen, has been exposed to light or temperatures above 86°F (30°C), or has been out of the refrigerator for 28 days or longer.

Keep WEGOVY® and all medicines out of the reach of children.

WEGOVY® pen parts

Expiration date
(on the back) Check that WEGOVY® has not expired.

Always check you have the medicine and dose that your healthcare provider prescribed. Either:

- 0.25 mg / 0.5 mL
- 0.5 mg / 0.5 mL
- 1 mg / 0.5 mL
- 1.7 mg / 0.75 mL
- 2.4 mg / 0.75 mL

Pen window
Check that WEGOVY® is clear and colorless. Air bubbles are normal. They do not affect your dose.

Needle cover
Needle is hidden inside.

Pen cap
Remove it just before you are ready to inject.

How to use your WEGOVY® pen
Do not use your WEGOVY® pen without receiving training from your healthcare provider. Make sure that you or your caregiver know how to give an injection with the pen before you start your treatment.

Read and follow the instructions so that you use your WEGOVY® pen correctly:

Preparation
Step 1. Prepare for your injection.
- Supplies you will need to give your WEGOVY® injection:
  - WEGOVY® pen
  - 1 alcohol swab or soap and water
  - 1 gauze pad or cotton ball
  - 1 sharps disposable container for used WEGOVY® pens
- Wash your hands.
- Check your WEGOVY® pen.
  - You may inject in the same body area each week, but
  - Your healthcare provider can help you choose the injection site that is best for you
- You may inject into your upper leg (front of the thigh), lower stomach (keep 2 inches away from your belly button) or upper arm.
- Do not inject into an area where the skin is tender, bruised, red, or hard. Avoid injecting into areas with scars or stretch marks.
- You may inject in the same body area each week, but make sure it is not in the same spot each time.
- Clean the injection site with an alcohol swab or soap and water. Do not touch the injection site after cleaning. Allow the skin to dry before injecting.

Step 2. Choose your injection site.
- Your healthcare provider can help you choose the injection site that is best for you
  - You may inject into your upper leg (front of the thigh), lower stomach (keep 2 inches away from your belly button) or upper arm.
Injection
Step 3. Remove pen cap.
• Pull the pen cap straight off your pen.

Step 4. Inject WEGOVY®.
• Push the pen firmly against your skin and keep applying pressure until the yellow bar has stopped moving. If the yellow bar does not start moving, press the pen more firmly against your skin.
• You will hear 2 clicks during the injection.
  • Click 1: the injection has started.
  • Click 2: the injection is ongoing.
• If you have problems with the injection, refer to the “Troubleshooting” section.

Click 1
The injection starts.

Click 2
Keep applying pressure until the yellow bar has stopped moving.

Yellow bar has stopped moving. The injection is complete. Lift the pen slowly.

Throw away pen
Step 5. Throw away (dispose of) pen.
Safely dispose of the WEGOVY® pen right away after each use. See “How do I throw away (dispose of) WEGOVY® pens?”

• What if blood appears after injection?
If blood appears at the injection site, press the site lightly with a gauze pad or cotton ball.

Troubleshooting
• If you have problems injecting, change to a more firm injection site, such as upper leg, or upper arm or consider standing up while injecting into the lower stomach.
• If medicine appears on the skin or squirts from the needle, make sure the next time you inject to keep applying pressure until the yellow bar has stopped moving. Then you can lift the pen slowly from your skin.

How do I throw away (dispose of) WEGOVY® pens?
Put the used WEGOVY® pen in an FDA-cleared sharps disposal container right away after use. Do not throw away (dispose of) the pen in your household trash.

If you do not have an FDA-cleared sharps disposal container, you may use a household container that is:
• made of a heavy-duty plastic,
• able to be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
• upright and stable during use,
• leak-resistant, and
• properly labeled to warn of hazardous waste inside the container.

When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles and syringes. For more information about safe sharps disposal, and for specific sharps disposal in the state that you live in, go to the FDA’s website at http://www.fda.gov/safesharpsdisposal.
• Do not reuse the pen.
• Do not recycle the pen or sharps disposal container, or throw them into household trash.

Important: Keep your WEGOVY® pen, sharps disposal container and all medicines out of the reach of children.

How do I care for my pen?
Protect your pen
• Do not drop your pen or knock it against hard surfaces.
• Do not expose your pen to any liquids.
• If you think that your pen may be damaged, do not try to fix it. Use a new one.
• Keep the pen cap on until you are ready to inject. Your pen will no longer be sterile if you store an unused pen without the cap, if you pull the pen cap off and put it on again, or if the pen cap is missing. This could lead to an infection.
